Introduction

Star-product  
quantization

Stückelberg -  
Petermann RG

Regularized  
time-ordered  
product

Flow of effective  
potential

Comparism with  
usual flow equation  
formalism

Conclusions

Different versions of RG, their relations are not completely understood.

This talk is restricted to perturbation theory and treats:

- ▶ **Stückelberg - Petermann RG**  $\mathcal{R}$  (Causal perturbation theory) Non-uniqueness of  $S$ -matrix.

Introduction

Star-product  
quantization

Stückelberg -  
Petermann RG

Regularized  
time-ordered  
product

Flow of effective  
potential

Comparism with  
usual flow equation  
formalism

Conclusions

Different versions of RG, their relations are not completely understood.

This talk is restricted to perturbation theory and treats:

- ▶ **Stückelberg - Petermann RG**  $\mathcal{R}$  (Causal perturbation theory) Non-uniqueness of  $S$ -matrix.

Change  $S \rightarrow \hat{S}$  of the renormalization prescription can be absorbed in a renormalization of the interaction  $V \rightarrow Z(V)$ :

$$\hat{S}(V) = S(Z(V)) \quad \forall V$$

$\mathcal{R} = \{\text{appearing } Z\}$  is a group - group of finite renormalizations of  $S$ .

- ▶ **RG in the sense of Wilson:** dependence of the theory on a cutoff  $\Lambda$ .

Introduction

Star-product  
quantization

Stückelberg -  
Petermann RG

Regularized  
time-ordered  
product

Flow of effective  
potential

Comparism with  
usual flow equation  
formalism

Conclusions

- ▶ **RG in the sense of Wilson:** dependence of the theory on a cutoff  $\Lambda$ .

In terms of regularized Feynman propagator  $p_\Lambda$  one defines regularized  $S$ -matrix  $S_\Lambda$ .

Introduction

Star-product  
quantization

Stückelberg -  
Petermann RG

Regularized  
time-ordered  
product

Flow of effective  
potential

Comparism with  
usual flow equation  
formalism

Conclusions

- ▶ **RG in the sense of Wilson:** dependence of the theory on a cutoff  $\Lambda$ .

In terms of regularized Feynman propagator  $p_\Lambda$  one defines regularized  $S$ -matrix  $S_\Lambda$ .

Definition of the effective potential  $V_\Lambda$  at scale  $\Lambda$ : Let  $V$  original interaction. Then

$$S_\Lambda(V_\Lambda) = S(V) \text{ i.e. } V_\Lambda := S_\Lambda^{-1} \circ S(V)$$

Introduction

Star-product  
quantization

Stückelberg -  
Petermann RG

Regularized  
time-ordered  
product

Flow of effective  
potential

Comparism with  
usual flow equation  
formalism

Conclusions

$S$  unknown  $\rightarrow$  One computes  $V_\Lambda$  by solving **flow equation**  
(Polchinski, Salmhofer, Kopper etc.):

$$\text{Def } V_\Lambda \quad \Rightarrow \quad \frac{d}{d\Lambda} V_\Lambda = F_\Lambda(V_\Lambda \otimes V_\Lambda)$$

where  $F_\Lambda$  is linear and explicitly known.

Introduction

Star-product  
quantization

Stückelberg -  
Petermann RG

Regularized  
time-ordered  
product

Flow of effective  
potential

Comparism with  
usual flow equation  
formalism

Conclusions

$S$  unknown  $\rightarrow$  One computes  $V_\Lambda$  by solving **flow equation**  
(Polchinski, Salmhofer, Kopper etc.):

$$\text{Def } V_\Lambda \quad \Rightarrow \quad \frac{d}{d\Lambda} V_\Lambda = F_\Lambda(V_\Lambda \otimes V_\Lambda)$$

where  $F_\Lambda$  is linear and explicitly known.

$S(V)$  is obtained by intergrating flow equation and  
computing

$$\lim_{\Lambda \rightarrow \infty} S_\Lambda(V_\Lambda)$$

Conclusions

Restrict talk to Minkowski space  $\mathbb{M}$  and real scalar field  $\varphi$ .  
field configuration space:  $C^\infty(\mathbb{M})$  (“off-shell formalism”)

### Definition of observables:

functionals  $F : C^\infty(\mathbb{M}) \rightarrow \mathbb{C}$ ,

$F$  is infinitely differentiable,  $\text{supp } \frac{\delta^n F}{\delta \varphi^n}$  is compact

- ▶  $\mathcal{F}_0 : \frac{\delta^n F}{\delta \varphi^n}$  is smooth (non-local functionals)
- ▶  $\mathcal{F} : \frac{\delta^n F}{\delta \varphi^n}$  is a distribution (includes local functionals)
- ▶  $(\mathcal{F} \supset) \mathcal{F}_{\text{loc}}$ : (local functionals)  
 $\frac{\delta^n F}{\delta \varphi^n}(x_1, \dots, x_n) = 0$  if  $x_i \neq x_j$  for some  $(i, j)$

Restrict talk to Minkowski space  $\mathbb{M}$  and real scalar field  $\varphi$ .  
field configuration space:  $C^\infty(\mathbb{M})$  (“off-shell formalism”)

### Definition of observables:

functionals  $F : C^\infty(\mathbb{M}) \rightarrow \mathbb{C}$ ,

$F$  is infinitely differentiable,  $\text{supp } \frac{\delta^n F}{\delta \varphi^n}$  is compact

- ▶  $\mathcal{F}_0 : \frac{\delta^n F}{\delta \varphi^n}$  is smooth (non-local functionals)
- ▶  $\mathcal{F} : \frac{\delta^n F}{\delta \varphi^n}$  is a distribution (includes local functionals)
- ▶  $(\mathcal{F} \supset) \mathcal{F}_{\text{loc}}$ : (local functionals)  
 $\frac{\delta^n F}{\delta \varphi^n}(x_1, \dots, x_n) = 0$  if  $x_i \neq x_j$  for some  $(i, j)$

In  $\mathcal{F}, \mathcal{F}_{\text{loc}}$  additional condition on  $\text{WF}(\frac{\delta^n F}{\delta \varphi^n})$  which is a  
microlocal version of translation invariance.

Example for a **local** observable:

$$F(\varphi) = \int dx f(x) L(\varphi(x), \partial\varphi(x), \dots),$$

$f \in \mathcal{D}$ ,  $L \in \mathcal{C}^\infty$  does not need to be a polynomial.

Example for a **local** observable:

$$F(\varphi) = \int dx f(x) L(\varphi(x), \partial\varphi(x), \dots),$$

$f \in \mathcal{D}$ ,  $L \in \mathcal{C}^\infty$  does not need to be a polynomial.

All functionals  $F \in \mathcal{F}$  are localized:

$\text{supp } F \equiv \text{supp } \frac{\delta F}{\delta \varphi}$  is compact.

$\text{supp } F \equiv \text{supp } \frac{\delta F}{\delta\varphi}$  is compact.

Commutative product:  $(F \cdot G)(\varphi) \stackrel{\text{def}}{=} F(\varphi) \cdot G(\varphi)$ .

## Poisson algebra of free fields

$\Delta_R, \Delta_A$ : retarded, advanced propagator of KG-operator

In terms of  $\Delta = \Delta_R - \Delta_A$  (commutator function) one defines Poisson bracket and obtains **Poisson algebra of free fields**.

$$\{F, G\} \stackrel{\text{def}}{=} \int dx dy \frac{\delta F}{\delta\varphi(x)} \Delta(x-y) \frac{\delta G}{\delta\varphi(y)}$$

## Definition of $\star_p$ (product with propagator $p$ ):

Let  $p \in \mathcal{S}'(\mathbb{M})$  with suitable properties which depend on whether the functionals  $F$  and  $G$  are non-local ( $F, G \in \mathcal{F}_0$ ) or not ( $F, G \in \mathcal{F}$ )

$$F \star_p G := \sum_{n \geq 0} \frac{\hbar^n}{n!} \int dx_1 \dots dy_1 \dots \frac{\delta^n F}{\delta \varphi(x_1) \dots \delta \varphi(x_n)} \\ p(x_1 - y_1) \dots p(x_n - y_n) \frac{\delta^n G}{\delta \varphi(y_1) \dots \delta \varphi(y_n)} .$$

## Definition of $\star_p$ (product with propagator $p$ ):

Let  $p \in \mathcal{S}'(\mathbb{M})$  with suitable properties which depend on whether the functionals  $F$  and  $G$  are non-local ( $F, G \in \mathcal{F}_0$ ) or not ( $F, G \in \mathcal{F}$ )

$$F \star_p G := \sum_{n \geq 0} \frac{\hbar^n}{n!} \int dx_1 \dots dy_1 \dots \frac{\delta^n F}{\delta \varphi(x_1) \dots \delta \varphi(x_n)} \\ p(x_1 - y_1) \dots p(x_n - y_n) \frac{\delta^n G}{\delta \varphi(y_1) \dots \delta \varphi(y_n)} .$$

The appearing product of distributions exists for  $F, G \in \mathcal{F}_0$  due to the wave front set property of the observables.

## Definition of $\star_p$ (product with propagator $p$ ):

Let  $p \in \mathcal{S}'(\mathbb{M})$  with suitable properties which depend on whether the functionals  $F$  and  $G$  are non-local ( $F, G \in \mathcal{F}_0$ ) or not ( $F, G \in \mathcal{F}$ )

$$F \star_p G := \sum_{n \geq 0} \frac{\hbar^n}{n!} \int dx_1 \dots dy_1 \dots \frac{\delta^n F}{\delta \varphi(x_1) \dots \delta \varphi(x_n)} \\ p(x_1 - y_1) \dots p(x_n - y_n) \frac{\delta^n G}{\delta \varphi(y_1) \dots \delta \varphi(y_n)} .$$

The appearing product of distributions exists for  $F, G \in \mathcal{F}_0$  due to the wave front set property of the observables.

$\Rightarrow \star_p$  is associative

## ★-product quantization

$\rho = H =$  Hadamard function, satisfies

$$H(z) - H(-z) = i\Delta(z) .$$

Introduction

Star-product  
quantization

Stückelberg -  
Petermann RG

Regularized  
time-ordered  
product

Flow of effective  
potential

Comparism with  
usual flow equation  
formalism

Conclusions

## ★-product quantization

$\rho = H =$  Hadamard function, satisfies

$$H(z) - H(-z) = i\Delta(z) .$$

$F \star_H G$  exists  $\forall F, G \in \mathcal{F}$  (since  $\exists (H(z))^n$ )

Introduction

Star-product  
quantization

Stückelberg -  
Petermann RG

Regularized  
time-ordered  
product

Flow of effective  
potential

Comparison with  
usual flow equation  
formalism

Conclusions

## $\star$ -product quantization

$\rho = H =$  Hadamard function, satisfies

$$H(z) - H(-z) = i\Delta(z) .$$

$F \star_H G$  exists  $\forall F, G \in \mathcal{F}$  (since  $\exists (H(z))^n$ )

$F \star_H G$  is a  $\star$ -product, i.e. it is  $\hbar$ -dependent deformation of  $F \cdot G$ ,

$$\lim_{\hbar \rightarrow 0} F \star_H G = F \cdot G ,$$

with

$$\lim_{\hbar \rightarrow 0} \frac{1}{i\hbar} (F \star_H G - G \star_H F) = \{F, G\} .$$

## Time ordered product

The time ordered product corresponding to  $\star$ -product  $\star_H$  must satisfy

$$\begin{aligned} T(\varphi(x)\varphi(y)) &:= \begin{cases} \varphi(x) \star_H \varphi(y) & \text{if } x^0 > y^0 \\ \varphi(y) \star_H \varphi(x) & \text{if } y^0 > x^0 \end{cases} \\ &= \varphi(x) \star_{H_F} \varphi(y) \end{aligned}$$

where  $H_F(z) := \Theta(z^0)H(z) + \Theta(-z^0)H(-z)(= H_F(-z))$ .

Introduction

Star-product  
quantization

Stückelberg -  
Petermann RG

Regularized  
time-ordered  
product

Flow of effective  
potential

Comparism with  
usual flow equation  
formalism

Conclusions

## Time ordered product

The time ordered product corresponding to  $\star$ -product  $\star_H$  must satisfy

$$\begin{aligned} T(\varphi(x)\varphi(y)) &:= \begin{cases} \varphi(x) \star_H \varphi(y) & \text{if } x^0 > y^0 \\ \varphi(y) \star_H \varphi(x) & \text{if } y^0 > x^0 \end{cases} \\ &= \varphi(x) \star_{H_F} \varphi(y) \end{aligned}$$

where  $H_F(z) := \Theta(z^0)H(z) + \Theta(-z^0)H(-z)(= H_F(-z))$ .

**Definition for non-local**  $F_1, \dots, F_n \in \mathcal{F}_0$ :

$T(F_1 \otimes \dots \otimes F_n) := F_1 \star_{H_F} \dots \star_{H_F} F_n$  (product with propagator  $H_F$ )

## Time ordered product

The time ordered product corresponding to  $\star$ -product  $\star_H$  must satisfy

$$\begin{aligned} T(\varphi(x)\varphi(y)) &:= \begin{cases} \varphi(x) \star_H \varphi(y) & \text{if } x^0 > y^0 \\ \varphi(y) \star_H \varphi(x) & \text{if } y^0 > x^0 \end{cases} \\ &= \varphi(x) \star_{H_F} \varphi(y) \end{aligned}$$

where  $H_F(z) := \Theta(z^0)H(z) + \Theta(-z^0)H(-z)(= H_F(-z))$ .

**Definition for non-local**  $F_1, \dots, F_n \in \mathcal{F}_0$ :

$T(F_1 \otimes \dots \otimes F_n) := F_1 \star_{H_F} \dots \star_{H_F} F_n$  (product with propagator  $H_F$ )

$\star_{H_F}$  is symmetric  $\Rightarrow \star_{H_F}$  is not a  $\star$ -product

## Time ordered product

The time ordered product corresponding to  $\star$ -product  $\star_H$  must satisfy

$$\begin{aligned} T(\varphi(x)\varphi(y)) &:= \begin{cases} \varphi(x) \star_H \varphi(y) & \text{if } x^0 > y^0 \\ \varphi(y) \star_H \varphi(x) & \text{if } y^0 > x^0 \end{cases} \\ &= \varphi(x) \star_{H_F} \varphi(y) \end{aligned}$$

where  $H_F(z) := \Theta(z^0)H(z) + \Theta(-z^0)H(-z)(= H_F(-z))$ .

**Definition for non-local**  $F_1, \dots, F_n \in \mathcal{F}_0$ :

$T(F_1 \otimes \dots \otimes F_n) := F_1 \star_{H_F} \dots \star_{H_F} F_n$  (product with propagator  $H_F$ )

$\star_{H_F}$  is symmetric  $\Rightarrow \star_{H_F}$  is not a  $\star$ -product

$F_1 \star_{H_F} \dots \star_{H_F} F_n$  exists **only** for **non-local**  $F_1, \dots, F_n \in \mathcal{F}_0$ , since  $\overline{\Delta}(H_F(z))^n$ .

Conclusions

## Regularized Feynman propagator

Propagator of time-ord. product is  $H_F(z)(= H_F(-z))$ .

As a cutoff we approximate  $H_F$  by a family of symmetric testfunctions (or sufficiently regular distributions)  $(p_\Lambda)_{\Lambda>0}$ :

$$\lim_{\Lambda \rightarrow \infty} p_\Lambda = H_F \quad \text{in appropriate topology}$$

and for  $\Lambda = 0$  it is required that  $p_0 = 0$ .

Conclusions

## Proposition:

$S_\Lambda$  is invertible (in contrast to  $S$ ).

**Proof:** write  $\star_{p_\Lambda}$  alternatively as

$$F \star_{p_\Lambda} G = \tau_\Lambda (\tau_\Lambda^{-1} F \cdot \tau_\Lambda^{-1} G) ,$$

where

$$\tau_\Lambda F \doteq \exp(i\hbar\Gamma_\Lambda) F$$

with

$$\Gamma_\Lambda \doteq \frac{1}{2} \int dx dy p_\Lambda(x-y) \frac{\delta^2}{\delta\varphi(x)\delta\varphi(y)} .$$

## Proposition:

$S_\Lambda$  is invertible (in contrast to  $S$ ).

**Proof:** write  $\star_{p_\Lambda}$  alternatively as

$$F \star_{p_\Lambda} G = \tau_\Lambda (\tau_\Lambda^{-1} F \cdot \tau_\Lambda^{-1} G),$$

where

$$\tau_\Lambda F \doteq \exp(i\hbar\Gamma_\Lambda)F$$

with

$$\Gamma_\Lambda \doteq \frac{1}{2} \int dx dy p_\Lambda(x-y) \frac{\delta^2}{\delta\varphi(x)\delta\varphi(y)}.$$

With that

$$S_\Lambda = \tau_\Lambda \circ \exp \circ \tau_\Lambda^{-1}$$

and hence

$$\exists S_\Lambda^{-1} = \tau_\Lambda \circ \log \circ \tau_\Lambda^{-1}. \quad \square$$

## Example: Euklidean theory with mass $m > 0$

(following Salmhofer). Let  $K(x)$  be a smooth approximation of  $\theta(1-x)$ . We set (in momentum space)

$$\hat{p}_\Lambda(k) := \frac{1}{(2\pi)^2 (k^2 + m^2)} K\left(\frac{k^2}{\Lambda^2}\right) \quad (k^2 \equiv k_0^2 + \vec{k}^2)$$

Introduction

Conclusions

## Construction of $S$ (renormalization) by adding counterterms and removing cutoff

$S_\Lambda$  diverges for  $\Lambda \rightarrow \infty$ ,

but for a renormalizable model there exists  $\forall \Lambda$  a  $Z_\Lambda \in \mathcal{R}$  with

$$\lim_{\Lambda \rightarrow \infty} S_\Lambda \circ Z_\Lambda = S .$$

$Z_\Lambda$  adds the **local** counter terms which are needed that limit exists.

**Flow of effective potential**

Comparism with usual flow equation formalism

Conclusions

## Definition of effective potential in terms of (unknown) $S$

Know that  $S$  exists (e.g. from Epstein - Glaser).

Define  $V_\Lambda$  ("effective potential at scale  $\Lambda$ ") by

(Exact theory with interaction  $V$ ) = (cutoff theory with  $V_\Lambda$ )

$$S(V) = S_\Lambda(V_\Lambda) , \quad \text{i.e.} \quad V_\Lambda := S_\Lambda^{-1} \circ S(V)$$

In general  $V_\Lambda$  is not an element of  $\mathcal{F}_{\text{loc}}$ .

## Definition of effective potential in terms of (unknown) $S$

Know that  $S$  exists (e.g. from Epstein - Glaser).

Define  $V_\Lambda$  ("effective potential at scale  $\Lambda$ ") by

(Exact theory with interaction  $V$ ) = (cutoff theory with  $V_\Lambda$ )

$$S(V) = S_\Lambda(V_\Lambda) , \quad \text{i.e.} \quad V_\Lambda := S_\Lambda^{-1} \circ S(V)$$

In general  $V_\Lambda$  is not an element of  $\mathcal{F}_{\text{loc}}$ .

For  $\Lambda = 0$  we have  $S_0(V) = e^V$ , hence

$$V_0 = \log \circ S(V) ,$$

but  $\lim_{\Lambda \rightarrow \infty} V_\Lambda$  does not exist in general.

## Theorem (Flow equation)

$$\begin{aligned} \frac{d}{d\Lambda} V_\Lambda &= -\frac{1}{2} \frac{d}{d\lambda} \Big|_{\lambda=\Lambda} (V_\Lambda \star_{p_\lambda} V_\Lambda) \\ &= -\frac{\hbar}{2} \int dx dy \frac{d p_\Lambda(x-y)}{d\Lambda} \frac{\delta V_\Lambda}{\delta \varphi(x)} \star_{p_\Lambda} \frac{\delta V_\Lambda}{\delta \varphi(y)} \end{aligned}$$

Introduction
