  - Time evolution and Painlevé 2
  - Gauge without apparent singularities
- 7 Open questions and outlooks

# Presentation of the problem

# General position of the talk

## General problem

How to quantize a “**classical spectral curve**” ( $[y, x] = 0$ )

$$P(x, y) = 0, \quad P \text{ rational in } x, \text{ monic polynomial in } y$$

into a **linear differential equation** ( $[\hbar\partial_x, x] = \hbar$ ):

$$\left( \hat{P} \left( x, \hbar \frac{d}{dx} \right) \right) \psi(x, \hbar) = 0?$$

$\hat{P}$  rational in  $x$  with **same pole structure** as  $P$ .

## Key ingredients

Key ingredient 1: Topological recursion [26].

Key ingredient 2: Integrable systems, Lax pairs:

$$\hbar \frac{\partial}{\partial x} \Psi(x, \hbar, t) = L(x, \hbar, t) \Psi(x, \hbar, t), \quad \hbar \frac{\partial}{\partial t} \Psi(x, \hbar, t) = A(x, \hbar, t) \Psi(x, \hbar, t)$$

# Strategy of the construction

- 1 Define proper initial data to apply topological recursion (TR)  
 $\Leftrightarrow$  **Minor technical restrictions on the classical spectral curve**  
 $P(x, y) = 0$ : “*Admissible initial data*”
- 2 Apply TR to initial data:  $\Rightarrow$  Output:  $(\omega_{h,n})_{h,n \geq 0}$ : “*TR differentials*”.
- 3 Stack the  $\omega_{h,n}$  into some “*perturbative wave function*”  $(\psi_i(z))_{i=1}^d$ .

$$\psi_i(z) = \exp \left( \sum_{h,n \geq 0} \frac{\hbar^{2h-2+n}}{n!} \int_{D_i} \cdots \int_{D_i} \left( \omega_{h,n}(z_1, \dots, z_n) - \frac{\delta_{h,0} \delta_{n,2} dx(z_1) dx(z_2)}{(x(z_1) - x(z_2))^2} \right) \right)$$

$\Rightarrow$  **formal WKB series in  $\hbar$** .

- 4 Take kind of “formal Fourier transform” to get “*non-perturbative wave functions*” and regroup them into a wave matrix  $\Psi^{\text{NP}}(\lambda; \hbar)$   
 $\Rightarrow$  **Formal trans-series in  $\hbar$** .
- 5 Prove that  $\hbar \partial_\lambda \Psi^{\text{NP}}(\lambda, \hbar) = L(\lambda, \hbar) \Psi^{\text{NP}}(\lambda, \hbar)$  with  $L$  rational with controlled pole structure.  $\Leftrightarrow$  “*Quantum curve*”.
- 6 Obtain *auxiliary systems*  $\hbar \partial_t \Psi^{\text{NP}}(\lambda, \hbar, t) = A(\lambda, \hbar, t) \Psi^{\text{NP}}(\lambda, \hbar, t)$  with  $A$  rational with controlled pole structure.

# Known results and applications

- **Review on TR and quantum curves by P. Norbury [35].**
- Elements of the strategy already existing in the literature [7, 20, 22, 25, 26, 34].
- Non-perturbative construction is not necessary for **genus 0 classical spectral curves**.
- **Several examples** worked out in details [16, 17, 18, 19, 29, 31, 38].
- **Reverse approach also exists [2, 5, 30, 33]:**  
 [Lax pair:  $(L(\lambda, \hbar), A(\lambda, \hbar)) + \text{Topological type property}] \Rightarrow$   
 $\Psi$  reconstructed by TR applied on the associated classical spectral curve  
 $\lim_{\hbar \rightarrow 0} \det(yI_d - L(\lambda, \hbar)) = 0.$
- Applications in enumerative geometry [1, 3, 4, 8, 13, 14, 21, 36, 37, 39, 27, 28].

# Summary of our results

- Results presented following [32] for  $sl_2$  case (hyper-elliptic case) and [24] **for the general  $gl_d$  case**. Similar works for  $sl_2$  case in [23].
- Connection with isomonodromic deformations only in  $sl_2$  case in [32].
- Technical assumptions include
  - **Pole of any degree including infinity.**
  - **Poles may be ramification points.**
  - **Ramifications points are simple and smooth.**
- Main results: Construction of the **matrix wave functions, quantum curve and some compatible auxiliary systems with same pole structure as the initial spectral curve.**
- Applications to **two examples**:  $gl_2$  example (recovering Painlevé 2 equation) and a  $gl_3$  example with only a single pole at infinity.

# Classical spectral curve, TR

# Classical spectral curve

## Classical spectral curve

Let  $(\Lambda_1, \dots, \Lambda_N)$  be  $N \geq 0$  distinct points on  $\mathbb{P}^1 \setminus \{\infty\}$ . Let  $\mathcal{H}_d(\Lambda_1, \dots, \Lambda_N, \infty)$  be the Hurwitz space of covers  $x: \Sigma \rightarrow \mathbb{P}^1$  of degree  $d$  defined as the Riemann surface

$$\Sigma := \overline{\{(\lambda, y) \mid P(\lambda, y) = 0\}},$$

where  $x(\lambda, y) := \lambda$  and

$$P(\lambda, y) = \sum_{l=0}^d (-1)^l y^{d-l} P_l(\lambda) = 0, \quad P_0(\lambda) = 1$$

with each coefficient  $(P_l)_{l \in \llbracket 1, d \rrbracket}$  **being a rational function with possible poles at  $\lambda \in \mathcal{P} := \{\Lambda_i\}_{i=1}^N \cup \{\infty\}$ .**

A *classical spectral curve*  $(\Sigma, x)$  is the data of the Riemann surface  $\Sigma$  and its realization as a Hurwitz cover of  $\mathbb{P}^1$ .

# Classical spectral curve with fixed pole structure

## Classical spectral curve with fixed pole structure

For  $l \in \llbracket 1, d \rrbracket$ , let  $r_\infty^{(l)}$  and  $\left(r_{\Lambda_i}^{(l)}\right)_{i=1}^N$  be some non-negative integers. We consider the subspace

$$\mathcal{H}_d \left( (\Lambda_1, (r_{\Lambda_1}^{(l)})_{i=1}^d), \dots, (\Lambda_N, (r_{\Lambda_N}^{(l)})_{i=1}^d), (\infty, (r_\infty^{(l)})_{i=1}^d) \right) \subset \mathcal{H}_d(\Lambda_1, \dots, \Lambda_N, \infty)$$

of covers  $x$  such that the rational functions  $(P_l)_{l=1}^d$  are of the form

$$P_l(\lambda) := \sum_{P \in \mathcal{P}} \sum_{k \in \mathbf{S}_P^{(l)}} P_{P,k}^{(l)} \xi_P(\lambda)^{-k}, \text{ for } l \in \llbracket 1, d \rrbracket,$$

where we have defined

$$\forall i \in \llbracket 1, N \rrbracket : \mathbf{S}_{\Lambda_i}^{(l)} := \llbracket \mathbf{1}, \mathbf{r}_{\Lambda_i}^{(l)} \rrbracket \quad \text{and} \quad \mathbf{S}_\infty^{(l)} := \llbracket \mathbf{0}, \mathbf{r}_\infty^{(l)} \rrbracket,$$

and the local coordinates  $\{\xi_P(\lambda)\}_{P \in \mathcal{P}}$  around  $P \in \mathcal{P}$  are defined by

$$\forall i \in \llbracket 1, N \rrbracket : \xi_{\Lambda_i}(\lambda) := (\lambda - \Lambda_i) \quad \text{and} \quad \xi_\infty(\lambda) := \lambda^{-1}.$$

# Canonical local coordinates and spectral times

## Canonical local coordinates

Let  $P \in \mathbb{P}^1$  and  $p \in x^{-1}(P)$ . Canonical coordinates on  $\mathbb{P}^1$  near  $P$  are

$$\begin{aligned}\xi_P(x) &:= x - P \quad \text{if } P \neq \infty, \quad \epsilon_P := 1, \\ \xi_P(x) &:= \frac{1}{x} \quad \text{if } P = \infty, \quad \epsilon_P := -1.\end{aligned}$$

Canonical local coordinates near any  $p \in x^{-1}(P)$  are

$$\zeta_p(z) = \xi_P(x(z))^{1/d_p}, \quad d_p = \text{order}_p(\xi_P).$$

## Spectral times (KP times)

The 1-form  $ydx$  has the following expansion:

$$ydx = \sum_{k=0}^{s_p-1} t_{p,k} \zeta_p^{-k-1} d\zeta_p + \text{analytic at } p.$$

$(t_{p,k})_{p \in x^{-1}(\mathcal{P}), k \in \llbracket 0, s_p-1 \rrbracket}$  are called “**spectral times**”.

# Ramification points and critical values

## Ramification points and critical values

We denote by  $\mathcal{R}_0$  the set of all ramification points of the cover  $x$ , and by  $\mathcal{R}$  the set of all ramification points that are not poles (i.e. not in  $x^{-1}(\mathcal{P})$ ),

$$\mathcal{R}_0 := \{p \in \Sigma / 1 + \text{order}_p dx \neq \pm 1\},$$

$$\mathcal{R} := \{p \in \Sigma / dx(p) = 0, x(p) \notin \mathcal{P}\} = \mathcal{R}_0 \setminus x^{-1}(\mathcal{P}).$$

We shall refer to their images  $x(\mathcal{R})$  as the *critical values* of  $x$ .

# Admissible spectral curve

## Admissible classical spectral curves

We say that a classical spectral curve  $(\Sigma, x)$  is *admissible* if it satisfies:

- The Riemann surface  $\Sigma$  defined by  $P(\lambda, y) = 0$  is an **irreducible algebraic curve**, i.e.  $P(\lambda, y)$  does not factorize.
- All **ramification points are simple**, i.e.  $dx$  has only a simple zero at  $a \in \mathcal{R}$ .
- **Critical values are distinct**: for any  $(a_i, a_j) \in \mathcal{R} \times \mathcal{R}$  such that  $a_i \neq a_j$  then  $x(a_i) \neq x(a_j)$ .
- **Ramification points are smooth**: for any  $a \in \mathcal{R}$ ,  $dy(a) \neq 0$  (i.e. the tangent vector  $(dx(a), dy(a))$  to the immersed curve  $\{(\lambda, y) \mid P(\lambda, y) = 0\}$  is not vanishing at  $a$ ).
- **Generic ramified poles**: for any pole  $p \in x^{-1}(\mathcal{P})$  ramified, the 1-form  $ydx$  has a pole of degree  $r_p \geq 3$  at  $p$ , and the corresponding spectral times satisfy  $t_{p, r_p-2} \neq 0$ .

# Remarks on the technical assumptions

- Topology of admissible spectral curves relatively to spectral times is complicated.  $\Rightarrow$  Spectral times are not independent. Tangent space and deformations hard to define for  $d \geq 3$ .
- Tangent space defined for  $d = 2 \leftrightarrow$  Existence of deformations  $\partial_{t_p, k}$ .
- Ingredients to lift some technical assumptions already exist in the literature: simple ramification points, smooth ramification points, reducible algebraic curves.
- Defining properly the tangent space would allow to make the connection with isomonodromic deformations for  $d \geq 3$ .
- Last condition allows **not to include ramified poles in the residues of TR**.

# Admissible initial data

## Admissible initial data

Given an **admissible spectral curve**  $(\Sigma, x)$  of genus  $g$ , we add

- **Choice of Torelli marking**  $(\mathcal{A}_i, \mathcal{B}_i)_{i=1}^g$ .  
 $\Leftrightarrow$  Associated “Bergman” kernel (normalized fundamental second kind differential)  $B^{(\mathcal{A}_i, \mathcal{B}_i)_{i=1}^g}$ .
- A generic smooth point  $o \in \Sigma \setminus x^{-1}(\mathcal{P})$  and some choice of non-intersecting homology chains  $\mathcal{C}_{o \rightarrow p}$  for each  $p \in x^{-1}(\mathcal{P})$  compatible with the Torelli marking:

$$\forall p \in x^{-1}(\mathcal{P}), \forall i \in \llbracket 1, g \rrbracket, \quad \mathcal{A}_i \cap \mathcal{C}_{o \rightarrow p} = 0 = \mathcal{B}_i \cap \mathcal{C}_{o \rightarrow p},$$

These three ingredients define some “**admissible initial data**” on which TR can be applied. Denoted  $((\Sigma, x), (\mathcal{A}_i, \mathcal{B}_i)_{i=1}^g)$ .

# General considerations

- Initial version [26] of TR dating back to 2007 is sufficient since ramification points are assumed simple.
- Some generalizations of TR exist to deal with non-simple ramification points, non-irreducible curves [6, 15].
- **TR takes admissible initial data as input and provides some TR differentials  $(\omega_{h,n})_{h \geq 0, n \geq 0}$  as output.**  
[https://en.wikipedia.org/wiki/Topological\\_recursion](https://en.wikipedia.org/wiki/Topological_recursion)
- These differentials are computed by recursion on  $s = n + 2h$  starting from

$$\omega_{0,1} := ydx, \quad \omega_{0,2} := B^{(\mathcal{A}_i, \mathcal{B}_i)}_{i=1}^g,$$

# Definition of TR

## Topological recursion

We have for  $h \geq 0$ ,  $n \geq 0$  with  $(h, n) \notin \{(0, 0), (0, 1)\}$ :

$$\omega_{h,n+1}(z_0, \mathbf{z}) := \sum_{a \in \mathcal{R}} \operatorname{Res}_{z \rightarrow a} \frac{1}{2} \frac{\int_{\sigma_a(z)}^z \omega_{0,2}(z_0, \cdot)}{\omega_{0,1}(z) - \sigma_a^* \omega_{0,1}(z)} \widetilde{\mathcal{W}}_{h,n+1}^{(2)}(z, \sigma_a(z); \mathbf{z}),$$

with

$$\begin{aligned} \widetilde{\mathcal{W}}_{h,n+1}^{(2)}(z, z'; \mathbf{z}) &:= \omega_{h-1,n+2}(z, z', \mathbf{z}) \\ &+ \sum_{\substack{A \sqcup B = \mathbf{z}, s \in \llbracket 0, h \rrbracket \\ (s, |A|) \notin \{(0, 0), (h, n)\}}} \omega_{s,|A|+1}(z, A) \omega_{h-s,|B|+1}(z', B) \end{aligned}$$

and

$$\omega_{h,0} := \frac{1}{2-2h} \sum_{a \in \mathcal{R}} \operatorname{Res}_{z \rightarrow a} \omega_{h,1}(z) \Phi(z), \quad \forall h \geq 2$$

and  $(\omega_{0,0}, \omega_{1,0})$  defined by specific formulas (See [26])

# Loop equations

- Some combinations of the TR differentials have interesting properties  $\Rightarrow$  “*Loop equations*”
- Following [7], for  $(h, n, l) \in \mathbb{N}^3$ :

$$\begin{aligned}
 Q_{h,n+1}^{(0)}(\lambda; z) &= \hat{Q}_{h,n+1}^{(0)}(\lambda; z) = \tilde{Q}_{h,n+1}^{(0)}(\lambda; z) = \delta_{h,0} \delta_{n,0}, \\
 Q_{h,n+1}^{(l)}(\lambda; z) &= \sum_{\beta \subseteq x^{-1}(\lambda)} \sum_{\mu \in \mathcal{S}(\beta)} \sum_{\substack{l(\mu) \\ \bigsqcup_{i=1}^l J_i = z}} \sum_{\substack{l(\mu) \\ \sum_{i=1}^l g_i = h + l(\mu) - l}} \left[ \prod_{i=1}^{l(\mu)} \omega_{g_i, |\mu_i| + |J_i|}(\mu_i, J_i) \right] \\
 \hat{Q}_{h,n+1}^{(l)}(z; z) &= \sum_{\beta \subseteq (x^{-1}(x(z)) \setminus \{z\})} \sum_{\mu \in \mathcal{S}(\beta)} \sum_{\substack{l(\mu) \\ \bigsqcup_{i=1}^l J_i = z}} \sum_{\substack{l(\mu) \\ \sum_{i=1}^l g_i = h + l(\mu) - l}} \left[ \prod_{i=1}^{l(\mu)} \omega_{g_i, |\mu_i| + |J_i|}(\mu_i, J_i) \right] \\
 \tilde{Q}_{h,n+1}^{(l)}(\lambda; z) &= \frac{Q_{h,n+1}^{(l)}(\lambda; z)}{(d\lambda)^l} - \sum_{j=1}^n dz_j \left( \frac{1}{\lambda - x(z_j)} \frac{\hat{Q}_{h,n}^{(l-1)}(z_j; z \setminus \{z_j\})}{(dx(z_j))^{l-1}} \right)
 \end{aligned}$$

## Loop equations

For any  $(h, n, l) \in \mathbb{N}^3$  and any  $\mathbf{z} \in (\Sigma \setminus \mathcal{R})^n$ , the function  $\lambda \mapsto \frac{Q_{h,n+1}^{(l)}(\lambda; z)}{(d\lambda)^l}$  has no poles at critical values.

# Perturbative wave functions

# Generic perturbative wave functions

## Perturbative wave functions

$((\Sigma, x), (\mathcal{A}_i, \mathcal{B}_i)_{i=1}^g)$  admissible initial data,  $D = \sum_{i=1}^s \alpha_i [p_i]$  generic divisor on  $\Sigma$ . *Perturbative wave functions* associated to  $D$  are

$$\psi(D, \hbar) := \exp \left( \sum_{h, n \geq 0} \frac{\hbar^{2h-2+n}}{n!} \int_D \cdots \int_D \omega_{h,n}(\mathbf{z}) - \delta_{h,0} \delta_{n,2} \frac{dx(z_1)dx(z_2)}{(x(z_1) - x(z_2))^2} \right)$$

$$\forall i \in [1, s] : \psi_{0,i}(D, \hbar) := \psi(D, \hbar),$$

$$\forall i \in [1, s], l \geq 1 : \psi_{l,i}(D, \hbar) := \left[ \sum_{h \geq 0} \sum_{n \geq 0} \frac{\hbar^{2h+n}}{n!} \overbrace{\int_D \cdots \int_D}^n \frac{\hat{Q}_{h,n+1}^{(l)}(p_i; \cdot)}{(dx(p_i))^l} \right] \psi(D, \hbar).$$

## Remark

Definition as a **formal power series in  $\hbar$  times exponential terms in finite negative powers of  $\hbar$**  (formal WKB series):

$$e^{-\hbar^{-2}\omega_{0,0}} e^{-\hbar^{-1} \int_D \omega_{0,1}} \psi(D, \hbar) \in \mathbb{C}[[\hbar]].$$

# KZ equations

- Loop equations translates into Knizhnik–Zamolodchikov (KZ) equations [7]

## Generic KZ equations

For  $i \in \llbracket 1, s \rrbracket$  and  $l \in \llbracket 0, d-1 \rrbracket$ , we have

$$\begin{aligned} \frac{\hbar}{\alpha_i} \frac{d\psi_{l,i}(D, \hbar)}{dx(p_i)} &= -\psi_{l+1,i}(D, \hbar) - \hbar \sum_{j \in \llbracket 1, s \rrbracket \setminus \{i\}} \alpha_j \frac{\psi_{l,i}(D, \hbar) - \psi_{l,j}(D, \hbar)}{x(p_i) - x(p_j)} \\ &+ \sum_{\hbar \geq 0} \sum_{n \geq 0} \frac{\hbar^{2h+n}}{n!} \int_{z_1 \in D} \cdots \int_{z_n \in D} \tilde{Q}_{h,n+1}^{(l+1)}(x(p_i); \mathbf{z}) \psi(D, \hbar) \\ &+ \left( \frac{1}{\alpha_i} - \alpha_i \right) \left[ \sum_{(h,n) \in \mathbb{N}^2} \frac{\hbar^{2h+n+1}}{n!} \overbrace{\int_D \cdots \int_D}^n \frac{d}{dx(p_i)} \left( \frac{\hat{Q}_{h,n+1}^{(l)}(p_i; \cdot)}{(dx(p_i))^l} \right) \right] \psi(D, \hbar). \end{aligned}$$

- Valid for generic divisors ( $p_i$  not a pole or a ramification point).
- Simplification for two points divisors with  $(\alpha_1, \alpha_2) \in \{-1, +1\}^2$ .

# Remarks

- KZ equations allow to obtain PDEs for  $\psi(D, \hbar)$ .
- Generic divisors provide PDEs with derivatives  $\frac{\partial}{\partial x(z)}$  up to order  $d^2$  generically.
- Quantum curve is expected to be of order  $d$  and not  $d^2$ .
- At least two specific choices of divisors allow for order  $d$ :  
 $D = [z] - [\infty^{(\alpha)}]$  or  $D = [z] - [\sigma(z)]$ .
- Other choices may also provide order  $d$  PDEs.

# Regularization of perturbative wave functions for

$$D = [z] - [\infty^{(\alpha)}]$$

Infinity is a pole of the classical spectral curve  $\Rightarrow D = [z] - [\infty^{(\alpha)}]$  is **not** a generic divisor  $\Rightarrow$  Some quantities requires **regularization** from

$$\lim_{\rho \rightarrow \infty^{(\alpha)}} ([z] - [\rho])$$

## Definition of regularized wave function

$$\psi^{\text{reg}}(D = [z] - [\infty^{(\alpha)}], \hbar) := \exp \left( \hbar^{-1} \left( V_{\infty^{(\alpha)}}(z) + \int_{\infty^{(\alpha)}}^z (y dx - dV_{\infty^{(\alpha)}}) \right) \right)$$

$$\frac{1}{E(z, \infty^{(\alpha)}) \sqrt{dx(z) d\zeta_{\infty^{(\alpha)}}(\infty^{(\alpha)})}} \exp \left( \sum_{n \geq 3\delta_{h,0}} \frac{\hbar^{2h-2+n}}{n!} \int_{\infty^{(\alpha)}}^z \cdots \int_{\infty^{(\alpha)}}^z \omega_{h,n} \right)$$

$$\psi_l^{\text{reg}}(D = [z] - [\infty^{(\alpha)}], \hbar) :=$$

$$\left( \sum_{n \geq 3\delta_{h,0}} \frac{\hbar^{2h+n}}{n!} \int_{\infty^{(\alpha)}}^z \cdots \int_{\infty^{(\alpha)}}^z \frac{\hat{Q}_{h,n+1}^{(l)}(z; z_1, \dots, z_n)}{dx(z)^l} \right) \psi^{\text{reg}}(D = [z] - [\infty^{(\alpha)}], \hbar)$$

# KZ equations for regularized wave functions

## KZ equations for regularized wave functions

$$\begin{aligned} & \hbar \frac{d}{dx(z)} \psi_l^{\text{reg}}(D = [z] - [\infty^{(\alpha)}], \hbar) + \psi_{l+1}^{\text{reg}}(D = [z] - [\infty^{(\alpha)}], \hbar) \\ &= \left[ \sum_{h \geq 0} \sum_{n \geq 0} \frac{\hbar^{2h+n}}{n!} \sum_{P \in \mathcal{P}} \sum_{k \in S_p^{(l+1)}} \xi_P(x(z))^{-k} \underset{\lambda \rightarrow P}{\text{Res}} \xi_P(\lambda)^{k-1} \right. \\ & \left. d\xi_P(\lambda) \int_{z_1 = \infty^{(\alpha)}}^{z_1 = z} \cdots \int_{z_n = \infty^{(\alpha)}}^{z_n = z} \frac{Q_{h,n+1}^{(l+1)}(\lambda; \mathbf{z})}{(d\lambda)^{l+1}} \right] \psi^{\text{reg}}(D = [z] - [\infty^{(\alpha)}], \hbar) \end{aligned}$$

# Comments and technical issue

- RHS of KZ equations uses residues, i.e. integrals.
- RHS may be rewritten using generalized integrals, i.e. **linear operators**  $\mathcal{I}_{\mathcal{C}_{p,k}}$ .
- $\mathcal{I}_{\mathcal{C}_{p,k}}$  is expected to correspond to  $\partial_{t_{p,k}}$ . Valid for  $d = 2$  and examples.
- Action of these operators is defined only on a sub-algebra generated by  $\int_{\mathcal{C}_1} \dots \int_{\mathcal{C}_n} \omega_{h,n}$ .  $\Leftrightarrow$  **Algebra of symbols**
- One need to check that these operators never act on something else.
- Avoid the problematic definition on all differential forms on  $\Sigma$ .

# PDE form of KZ equations

## PDE form of KZ equations

$$\hbar \frac{d}{dx(z)} \psi_l^{\text{reg}}([z] - [\infty^{(\alpha)}]) + \psi_{l+1}^{\text{reg}}([z] - [\infty^{(\alpha)}]) = \text{ev. } \tilde{\mathcal{L}}_l(x(z)) \left[ \psi^{\text{reg symb}}([z] - [\infty^{(\alpha)}]) \right]$$

with

$$\tilde{\mathcal{L}}_l(x(z)) = \sum_{P \in \mathcal{P}} \sum_{k \in S_P^{(l+1)}} \xi_P(x(z))^{-k} \tilde{\mathcal{L}}_{P,k,l}$$

# Definition of the operators

## Definition of the operators $\tilde{\mathcal{L}}_{P,k,l}$

$$\begin{aligned}
 \tilde{\mathcal{L}}_{P,k,l} &= \epsilon_P^{l+1} \left[ \xi_P(x(z))^{-(l+1)\epsilon_P} \sum_{\ell'=0}^{l+1} \sum_{\nu' \subset_{\ell'} \llbracket 1, d \rrbracket} \prod_{j \in \nu'} \left( \sum_{m=0}^{r_{P(j)}-1} \frac{t_{P(j),m}}{d_{P(j)}} \xi_P^{-\frac{m}{d_{P(j)}}} \right) \right. \\
 &\quad \sum_{0 \leq \ell'' \leq \frac{l+1-\ell'}{2}} \sum_{\substack{\nu'' \in \mathcal{S}^{(2)}(\llbracket 1, d \rrbracket \setminus \nu') \\ l(\nu'') = \ell''}} \prod_{i=1}^{\ell''} \frac{\hbar^2 R^{(P)}_{\nu''_i}}{d_{P(\nu''_i, +)} d_{P(\nu''_i, -)}} \\
 &\quad \left. \sum_{\nu \substack{\subset \\ l+1-\ell'-2\ell''} \llbracket 1, d \rrbracket \setminus (\nu' \cup \nu'')} \prod_{j \in \nu} \left( \hbar^2 \sum_{m=1}^{\infty} \frac{\xi_P^{\frac{m}{d_{P(j)}}}}{d_{P(j)}} \mathcal{I}_{C_{P(j),k}} \right) \right]_{-k} \\
 + \hbar \delta_{P,\infty} \frac{\epsilon_\infty^{l+1}}{d_{\infty(\alpha)}} &\left[ \xi_\infty(x(z))^{-(l+1)\epsilon_\infty} \sum_{\ell'=0}^{l+1} \sum_{\nu' \subset_{\ell'} \llbracket 1, d \rrbracket \setminus \{\alpha\}} \prod_{j \in \nu'} \left( \sum_{m=0}^{r_{\infty(j)}-1} \frac{t_{\infty(j),k}}{d_{\infty(j)}} \xi_\infty^{-\frac{m}{d_{\infty(j)}}} \right) \right. \\
 &\quad \sum_{0 \leq \ell'' \leq \frac{l+1-\ell'}{2}} \sum_{\substack{\nu'' \in \mathcal{S}^{(2)}(\llbracket 1, d \rrbracket \setminus (\nu' \cup \{\alpha\})) \\ l(\nu'') = \ell''}} \prod_{i=1}^{\ell''} \frac{\hbar^2 R^{(\infty)}_{\nu''_i}}{d_{\infty(\nu''_i, +)} d_{\infty(\nu''_i, -)}} \\
 &\quad \left. \sum_{\nu \substack{\subset \\ l-\ell'-2\ell''} \llbracket 1, d \rrbracket \setminus (\nu' \cup \nu'' \cup \{\alpha\})} \prod_{j \in \nu} \left( \hbar^2 \sum_{m=1}^{\infty} \frac{\xi_\infty^{\frac{m}{d_{\infty(j)}}}}{d_{\infty(j)}} \mathcal{I}_{C_{\infty(j),m}} \right) \right]_{-k}
 \end{aligned}$$

# Monodromies

- Perturbative wave functions have **bad monodromies** on  $\mathcal{B}$ -cycles.
- Monodromies are directly connected to **a shift of the filling fractions**  
 $\epsilon_i = \oint_{\mathcal{A}_i} \omega_{0,1}$  **by  $\hbar$ .**
- Monodromies issues only arises for genus  $g > 0$  classical spectral curves.
- Solution is to “sum over filling fractions”  $\Rightarrow$  Formal Fourier transform  $\Rightarrow$  **non-perturbative corrections.**

# Non-perturbative wave functions

# Non perturbative wave functions

## Non perturbative wave functions

$$\psi_{\text{NP}}(D; \hbar, \rho) := e^{\hbar^{-2}\omega_{0,0} + \omega_{1,0}} e^{\hbar^{-1} \int_D \omega_{0,1}} \frac{1}{E(D)} \sum_{r=0}^{\infty} \hbar^r G^{(r)}(D; \rho)$$

where  $E$  prime form on  $\Sigma$  and

$$G^{(r)}(D; \rho) := \sum_{k=0}^{3r} \sum_{(i_1, \dots, i_k) \in \llbracket 1, g \rrbracket^k} \Theta^{(i_1, \dots, i_k)}(\mathbf{v}, \tau) G_{(i_1, \dots, i_k)}^{(r)}(D)$$

with

$$\nu_j := \frac{\rho_j + \phi_j}{\hbar} + \mu_j^{(\alpha)}(z), \quad \phi_j := \frac{1}{2\pi i} \oint_{\mathcal{B}_j} \omega_{0,1}, \quad \mu_j^{(\alpha)}(z) := \frac{1}{2\pi i} \int_D \oint_{\mathcal{B}_j} \omega_{0,2}.$$

Moreover

$$\psi_{l, \text{NP}}^{\infty(\alpha)}(z, \hbar, \rho) := \sum_{\beta \subseteq \mathbb{C} \setminus (x^{-1}(x(z)) \setminus \{z\})} \frac{1}{l!} \text{ev.} \left( \prod_{j=1}^l \mathcal{I}_{\mathcal{C}_{\beta_j, 1}} \right) \psi_{\text{NP}}^{\text{symbol}}(D; \hbar, \rho).$$

and  $d \times d$  wave functions matrix

$$\widehat{\Psi}_{\text{NP}}(\lambda, \hbar, \rho) := \left[ \psi_{l-1, \text{NP}}^{\infty(\alpha)}(z^{(\alpha)}(\lambda), \hbar, \rho) \right]_{1 \leq l, \alpha \leq d},$$

# Trans-series in $\hbar$

- Non-perturbative quantities are **formal trans-series in  $\hbar$**  of the form

$$\sum_{r=0}^{\infty} \sum_{\mathbf{n} \in \mathbb{Z}^g} \hbar^r e^{\frac{1}{\hbar} \sum_{j=1}^g n_j \phi_j} F_{r, \mathbf{n}},$$

- Equalities should only be consider coefficients by coefficients in the trans-monomials.
- Non-perturbative wave functions satisfy same KZ equations as the perturbative wave functions.
- Non-perturbative wave functions have **good monodromies**.  $\Rightarrow$  **rational functions** of  $\lambda$ .

# Lax pairs

# Lax systems

## Lax systems

We have the Lax systems

$$\begin{aligned} \hbar \frac{d\widehat{\Psi}_{\text{NP}}(\lambda, \hbar)}{d\lambda} &= \widehat{L}(\lambda, \hbar) \widehat{\Psi}_{\text{NP}}(\lambda, \hbar) \\ \hbar^{-1} \text{ev.} \mathcal{L}_{P,k,l} \widehat{\Psi}_{\text{NP}}^{\text{symbol}}(\lambda, \hbar) &= \widehat{A}_{P,k,l}(\lambda, \hbar) \widehat{\Psi}_{\text{NP}}(\lambda, \hbar) \end{aligned}$$

with

$$\begin{aligned} \widehat{L}(\lambda, \hbar) &= \left[ -\widehat{P}(\lambda) + \hbar \sum_{P \in \mathcal{P}} \sum_{k \in \mathbb{N}} \xi_P^{-k}(\lambda) \widehat{\Delta}_{P,k}(\lambda, \hbar) \right] \\ \left[ \widehat{\Delta}_{P,k}(\lambda, \hbar) \right]_{2,j} &= \left[ \widehat{A}_{P,k,l}(\lambda, \hbar) \right]_{1,j}, \quad \forall j \in \llbracket 1, d \rrbracket, \end{aligned}$$

and

$$\widehat{P}(\lambda) := \begin{bmatrix} -P_1(\lambda) & 1 & 0 & \dots & 0 \\ -P_2(\lambda) & 0 & 1 & \dots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ -P_{d-1}(\lambda) & 0 & 0 & \dots & 1 \\ -P_d(\lambda) & 0 & 0 & \dots & 0 \end{bmatrix}$$

# Gauge transformation to recover companion-like matrix when $\hbar \rightarrow 0$

Define

$$G(\lambda) := \begin{bmatrix} 1 & 0 & 0 & \dots & 0 & 0 \\ P_1(\lambda) & -1 & 0 & \dots & 0 & 0 \\ P_2(\lambda) & -P_1(\lambda) & 1 & \dots & 0 & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots & \vdots \\ P_{d-2}(\lambda) & -P_{d-3}(\lambda) & P_{d-4}(\lambda) & \dots & (-1)^{d-2} & 0 \\ P_{d-1}(\lambda) & -P_{d-2}(\lambda) & P_{d-3}(\lambda) & \dots & (-1)^{d-2}P_1(\lambda) & (-1)^{d-1} \end{bmatrix}$$

and

$$\begin{aligned} \tilde{\Psi}(\lambda, \hbar) &:= (G(\lambda))^{-1} \hat{\Psi}_{\text{NP}}(\lambda, \hbar) \\ \hbar \frac{d\tilde{\Psi}(\lambda, \hbar)}{d\lambda} &= \tilde{L}(\lambda, \hbar) \tilde{\Psi}(\lambda, \hbar) \\ \hbar^{-1} \text{ev. } \mathcal{L}_{P,k,l} \tilde{\Psi}(\lambda, \hbar) &= \tilde{A}_{P,k,l}(\lambda, \hbar) \tilde{\Psi}(\lambda) \end{aligned}$$

with

$$\tilde{L}(\lambda, \hbar) = \left[ \tilde{P}(\lambda) + \hbar \sum_{P \in \mathcal{P}} \sum_{k \in \mathbb{N}} \xi_P^{-k}(\lambda) \tilde{\Delta}_{P,k}(\lambda, \hbar) \right]$$

$\tilde{P}(\lambda)$  companion-like matrix associated to classical spectral curve.

# Main result: pole structure of the Lax system

## Pole structure of the Lax system

Matrices  $\tilde{A}_{P,k,l}(\lambda, \hbar)$  are **rational functions** of  $\lambda$  with **no pole at critical values**  $u \in X(\mathcal{R})$ .

Matrices  $\tilde{L}(\lambda, \hbar)$  and  $\hat{L}(\lambda, \hbar)$  are **rational functions** of  $\lambda$  with possible **poles only at**  $\lambda \in \mathcal{P}$  and at **zeroes of the Wronskian**  $\det \hat{\Psi}_{\text{NP}}(\lambda, \hbar)$  (i.e. *apparent singularities*).

- Long and technical proof by induction on the order in the trans-series.
- Proof uses some of admissibility conditions (distinct critical values, smooth and simple ramification points).
- Proof should adapt without the admissibility conditions but involving more technical computations.

# Quantum curve

## Quantum curve

$\forall j \in \llbracket 1, d \rrbracket$ ,  $\psi_{0, \text{NP}}^{\infty(\alpha)}(z^{(j)}(\lambda), \hbar)$  is solution to a degree  $d$  ODE of the form

$$\forall j \in \llbracket 1, d \rrbracket : \sum_{k=0}^d b_{d-k}(\lambda, \hbar) \left( \hbar \frac{\partial}{\partial \lambda} \right)^k \psi_{0, \text{NP}}^{\infty(\alpha)}(z^{(j)}(\lambda), \hbar) = 0,$$

Coefficients  $(b_l(\lambda, \hbar))_{l \in \llbracket 0, d \rrbracket}$  with  $b_0(\lambda, \hbar) = 1$  are **rational functions** of  $\lambda$  with **poles only at  $\lambda \in \mathcal{P}$  and zeros of the Wronskian**.

$\Leftrightarrow$  Matrix form:  $\Psi(\lambda, \hbar) := \left[ \left( \hbar \frac{\partial}{\partial \lambda} \right)^{i-1} \psi_{0, \text{NP}}^{\infty(\alpha)}(z^{(j)}(\lambda), \hbar) \right]_{1 \leq i, j \leq d}$  satisfies:

$$\begin{aligned} \hbar \frac{\partial}{\partial \lambda} \Psi(\lambda, \hbar) &= \begin{bmatrix} 0 & 1 & \dots & 0 \\ \vdots & \ddots & \ddots & \vdots \\ 0 & 0 & \dots & 1 \\ -b_d(\lambda, \hbar) & -b_{d-1}(\lambda, \hbar) & \dots & -b_1(\lambda, \hbar) \end{bmatrix} \Psi(\lambda, \hbar) \\ &:= L(\lambda, \hbar) \Psi(\lambda, \hbar) \end{aligned}$$

# Gauge transformation to remove apparent singularities

- Apparent singularities  $\Leftrightarrow$  zeros of Wronskian:

$$W(\lambda, \hbar) := \det \Psi(\lambda, \hbar) = \kappa \frac{\prod_{i=1}^G (\lambda - q_i(\hbar))}{\prod_{i=1}^N (\lambda - \Lambda_i)^{G\Lambda_i}} \exp\left(\hbar^{-1} \int_0^\lambda P_1(\lambda) d\lambda\right),$$

- Explicit gauge transformation  $J(\lambda, \hbar)$  to **remove apparent singularities**

$$\check{\Psi}(\lambda, \hbar) := \begin{bmatrix} 1 & \dots & 0 & 0 \\ \vdots & \ddots & & \vdots \\ 0 & \dots & 1 & 0 \\ \frac{Q_d(\lambda, \hbar)}{\prod_{i=1}^G (\lambda - q_i(\hbar))} & \dots & \frac{Q_2(\lambda, \hbar)}{\prod_{i=1}^G (\lambda - q_i(\hbar))} & \frac{Q_1(\lambda, \hbar)}{\prod_{i=1}^G (\lambda - q_i(\hbar))} \end{bmatrix} \Psi(\lambda, \hbar)$$

- $Q_j$ : polynomial of degree  $G - 1$  at most defined by interpolation.
- Gauge transformation does not introduce new poles because

$$\det J(\lambda, \hbar) = \left( \prod_{k=1}^N (\lambda - \Lambda_k)^{G\Lambda_k} \right) \left( \prod_{i=1}^G (\lambda - q_i(\hbar)) \right)^{-1}$$

# Remarks

## 4 equivalent gauges:

- Gauge  $\hat{\Psi}(\lambda, \hbar)$ : Natural gauge from KZ equations and provides compatible auxiliary systems. But leading order in  $\hbar$  of  $\hat{L}(\lambda, \hbar)$  is not companion-like  $\Rightarrow$  Classical spectral curve is not easily recovered. Contains apparent singularities.
- Gauge  $\tilde{\Psi}(\lambda, \hbar)$ : Same properties as the previous gauge ( $\hbar^0$  gauge transformation) except leading order in  $\hbar$  is companion-like and recovers the classical spectral curve.
- Gauge  $\Psi(\lambda, \hbar)$ :  $L(\lambda, \hbar)$  is companion-like  $\Rightarrow$  Quantum curve is directly read in the last line of  $L(\lambda, \hbar)$ . Classical spectral curve directly obtained as  $\hbar \rightarrow 0$  limit of  $L(\lambda, \hbar)$ . But contains apparent singularities. Natural framework for Darboux coordinates and isomonodromic deformations.
- Gauge  $\check{\Psi}$ :  $\check{L}(\lambda, \hbar)$  has no apparent singularity. But no longer companion like (last two lines are non-trivial) so less adapted to read the classical and quantum curves.

# Example

# Classical spectral curve

## Classical spectral curve

We take  $d = 2$ ,  $N = 0$ ,  $r_{\infty}^{(1)} = 2$  and  $r_{\infty}^{(2)} = 4$ . Two points above infinity denoted by  $\infty^{(1)}$  and  $\infty^{(2)}$  non-ramified.

$$y^2 - P_1(\lambda)y + P_2(\lambda) = 0,$$

with

$$\begin{aligned} P_1(\lambda) &= P_{\infty,2}^{(1)}\lambda^2 + P_{\infty,1}^{(1)}\lambda + P_{\infty,0}^{(1)} \\ P_2(\lambda) &= P_{\infty,4}^{(2)}\lambda^4 + P_{\infty,3}^{(2)}\lambda^3 + P_{\infty,2}^{(2)}\lambda^2 + P_{\infty,1}^{(2)}\lambda + P_{\infty,0}^{(2)} \end{aligned}$$

6 Spectral times  $(t_{i,j})_{1 \leq i \leq 2, 0 \leq j \leq 3}$  are defined by  $\forall i \in \{1, 2\}$ :

$$y(z) = -t_{i,3}x(z)^2 - t_{i,2}x(z) - t_{i,1} - t_{i,0}x(z)^{-1} + O(x(z)^{-2}), \text{ as } z \rightarrow \infty^{(i)}$$

# Connection with spectral times

Relations between spectral times and Coefficients of the classical spectral curve:

$$P_{\infty,2}^{(1)} = -t_{1,3} - t_{2,3}$$

$$P_{\infty,1}^{(1)} = -t_{1,2} - t_{2,2}$$

$$P_{\infty,0}^{(1)} = -t_{1,1} - t_{2,1}$$

$$P_{\infty,4}^{(2)} = t_{1,3}t_{2,3}$$

$$P_{\infty,3}^{(2)} = t_{1,2}t_{2,3} + t_{1,3}t_{2,2}$$

$$P_{\infty,2}^{(2)} = t_{1,2}t_{2,2} + t_{1,3}t_{2,1} + t_{1,1}t_{2,3}$$

$$P_{\infty,1}^{(2)} = t_{1,3}t_{2,0} + t_{1,0}t_{2,3} + t_{1,2}t_{2,1} + t_{1,1}t_{2,2}$$

and  $0 = -t_{1,0} - t_{2,0}$ .

# KZ equations

Using the general theory, we get:

## KZ equations

$$\begin{cases} \hbar \frac{\partial \psi_{0, \text{NP}}^{\infty(1)}(z, \hbar)}{\partial x(z)} + \psi_{1, \text{NP}}^{\infty(1)}(z, \hbar) = P_1(x(z)) \psi_{0, \text{NP}}^{\infty(1)}(z, \hbar), \\ \hbar \frac{\partial \psi_{1, \text{NP}}^{\infty(1)}(z, \hbar)}{\partial x(z)} = P_2(x(z)) \psi_{0, \text{NP}}^{\infty(1)}(z, \hbar) + \hbar \text{ev. } \mathcal{L}_{\text{KZ}}(x(z)) \left[ \psi_{0, \text{NP}}^{\infty(1), \text{symbol}}(z, \hbar) \right] \end{cases}$$

where

$$\mathcal{L}_{\text{KZ}}(\lambda) := \hbar \mathbf{t}_{1,3} \mathcal{I}c_{\infty(2),1} + \hbar \mathbf{t}_{2,3} \mathcal{I}c_{\infty(1),1} - \mathbf{t}_{2,3} \lambda - \mathbf{t}_{2,2}$$

# Lax pair from KZ equations

Define  $\Psi(\lambda, \hbar) = \begin{pmatrix} \psi_{0, \text{NP}}^{\infty(\alpha)}(z^{(1)}(\lambda), \hbar) & \psi_{0, \text{NP}}^{\infty(\alpha)}(z^{(2)}(\lambda), \hbar) \\ \hbar \partial_\lambda \psi_{0, \text{NP}}^{\infty(\alpha)}(z^{(1)}(\lambda), \hbar) & \hbar \partial_\lambda \psi_{0, \text{NP}}^{\infty(\alpha)}(z^{(2)}(\lambda), \hbar) \end{pmatrix}$

KZ equations are equivalent to

$$\hbar \partial_\lambda \Psi(\lambda, \hbar) = \begin{pmatrix} 0 & 1 \\ -P_2(\lambda) + \hbar P_1'(\lambda) + H - \frac{p}{\lambda - q} + \hbar \alpha \lambda & P_1(\lambda) + \frac{\hbar}{\lambda - q} \end{pmatrix} \Psi(\lambda, \hbar)$$

$$\text{ev. } \mathcal{L}_{\text{KZ}}(\lambda) [\Psi^{\text{symbol}}(\lambda, \hbar)] = \begin{pmatrix} -\alpha \lambda - \frac{H}{\hbar} + \frac{p}{\hbar(\lambda - q)} & -\frac{1}{\lambda - q} \\ [A_{\text{KZ}}]_{2,1}(\lambda, \hbar) & [A_{\text{KZ}}]_{2,2}(\lambda, \hbar) \end{pmatrix} \Psi(\lambda, \hbar)$$

for  $\alpha = t_{1,3} + 2t_{2,3}$  and some unknown  $H$ .

Equivalently defining

$$\mathcal{L} := \mathcal{L}_{\text{KZ}}(\lambda) + t_{2,3} \lambda + t_{2,2} = \hbar t_{1,3} \mathcal{I}_{\infty(2),1} + \hbar t_{2,3} \mathcal{I}_{\infty(1),1}$$

we have

$$\begin{aligned} \text{ev. } \mathcal{L} [\Psi^{\text{symbol}}(\lambda, \hbar)] &= \begin{pmatrix} P_{\infty,2}^{(1)} \lambda + t_{2,2} - \frac{H}{\hbar} + \frac{p}{\hbar(\lambda - q)} & -\frac{1}{\lambda - q} \\ A_{2,1}(\lambda, \hbar) & A_{2,2}(\lambda, \hbar) \end{pmatrix} \Psi(\lambda, \hbar) \\ &:= A(\lambda, \hbar) \Psi(\lambda, \hbar) \end{aligned}$$

# Evolution equations

- Compatibility equations  $\mathcal{L}[L(\lambda, \hbar)] = \hbar \partial_\lambda A(\lambda, \hbar) + [A(\lambda, \hbar), L(\lambda, \hbar)]$ :

$$\mathcal{L}[P_{\infty,4}^{(2)}] = \mathcal{L}[P_{\infty,3}^{(2)}] = 0$$

$$\mathcal{L}[P_{\infty,2}^{(2)}] = -2\hbar P_{\infty,4}^{(2)} + \hbar [P_{\infty,2}^{(1)}]^2$$

$$\mathcal{L}[P_{\infty,1}^{(2)}] = -\hbar P_{\infty,3}^{(2)} + \hbar P_{\infty,1}^{(1)} P_{\infty,2}^{(1)}$$

$$\mathcal{L}[P_{\infty,0}^{(2)}] - \mathcal{L}[H] = 2\hbar P_{\infty,4}^{(2)} q^2 + \hbar P_{\infty,3}^{(2)} q - P_{\infty,2}^{(1)} p + \hbar P_{\infty,0}^{(1)} P_{\infty,2}^{(1)}$$

$$H = \frac{p^2}{\hbar^2} - P_1(q) \frac{p}{\hbar} + P_2(q) - \hbar P_1'(q) + \hbar (P_{\infty,2}^{(1)} - t_{2,3}) q$$

$$\mathcal{L}[q] = P_1(q) - 2 \frac{p}{\hbar}$$

$$\mathcal{L}[p] = -P_1'(q) p + \hbar P_2'(q) + \hbar^2 t_{2,3}$$

- Equivalent to

$$\mathcal{L}[t_{1,3}] = \mathcal{L}[t_{2,3}] = \mathcal{L}[t_{1,2}] = \mathcal{L}[t_{1,0}] = \mathcal{L}[t_{2,0}] = 0, \quad \mathcal{L}[t_{1,1}] = \hbar t_{2,3}, \quad \mathcal{L}[t_{2,1}] = \hbar t_{1,3}$$

- Equivalent to  $\mathcal{L} = \hbar t_{2,3} \partial_{t_{1,1}} + \hbar t_{1,3} \partial_{t_{2,1}}$

# Hamiltonian evolution

## Hamiltonian evolution

“Time” ( $\mathcal{L}$ )-evolution is Hamiltonian  $\Leftrightarrow (p, q)$  are Darboux coordinates

$$\mathcal{L}[q] = -\hbar \frac{\partial H_0}{\partial p}, \quad \mathcal{L}[p] = \hbar \frac{\partial H_0}{\partial q}$$

for Hamiltonian  $H_0(p, q, \hbar)$ :

$$H_0(p, q, \hbar) = \frac{p^2}{\hbar^2} - P_1(q) \frac{p}{\hbar} + P_2(q) - \hbar P_1'(q) + \hbar q (2P_{\infty,2}^{(1)} - t_{2,3})$$

giving  $H = H_0(p, q, \hbar) + \hbar(t_{1,3} + t_{2,3})q$ .

# Connection with the Painlevé 2 equation

- $q$  satisfies the evolution equation:

$$\begin{aligned} \mathcal{L}^2[q] = & 2(t_{1,3} - t_{2,3})^2 q^3 + 3(t_{1,3} - t_{2,3})(t_{1,2} - t_{2,2})q^2 \\ & + ((t_{1,2} - t_{2,2})^2 + 2(t_{1,3} - t_{2,3})(t_{1,1} - t_{2,1}))q \\ & + (t_{1,2} - t_{2,2})(t_{1,1} - t_{2,1}) + (2t_{1,0} - \hbar)(t_{1,3} - t_{2,3}) \end{aligned}$$

- Change of variables  $(t_{1,1}, t_{2,1}) \leftrightarrow (\tau, \tilde{\tau})$  and affine rescaling:

$$\begin{aligned} \tau &= \frac{1}{t_{1,3} - t_{2,3}} (t_{2,1} - t_{1,1}), \quad \tilde{\tau} = \frac{1}{t_{1,3} - t_{2,3}} (t_{1,3}t_{1,1} - t_{2,3}t_{2,1}) \\ t &= \left(-2(t_{1,3} - t_{2,3})^2\right)^{\frac{1}{3}} \left(\tau + \frac{(t_{1,2} - t_{2,2})^2}{4(t_{1,3} - t_{2,3})^2}\right) \\ \tilde{q} &= \left(\frac{-(t_{1,3} - t_{2,3})}{2}\right)^{\frac{1}{3}} \left(q + \frac{t_{1,2} - t_{2,2}}{2(t_{1,3} - t_{2,3})}\right) \end{aligned}$$

Then  $\tilde{q}(t, \hbar)$  satisfies the Painlevé 2 equation

$$\hbar^2 \partial_t^2 \tilde{q} = 2\tilde{q}^3 + t\tilde{q} - \left(t_{1,0} - \frac{\hbar}{2}\right)$$

# Gauge without apparent singularities

- Gauge transformation to remove apparent singularity:

$$\check{\Psi}(\lambda, \hbar) = \begin{pmatrix} 1 & 0 \\ -\frac{p}{\hbar(\lambda-q)} & \frac{1}{\lambda-q} \end{pmatrix} \Psi(\lambda, \hbar) := J(\lambda, \hbar) \Psi(\lambda, \hbar)$$

- Provides another Lax pair (**Jimbo-Miwa type**) **without apparent singularity**:

$$\begin{aligned} \check{L}(\lambda, \hbar) &= \begin{pmatrix} \frac{p}{\hbar} & \lambda - q \\ -((\lambda + q)(t_{1,3} + t_{2,3}) + t_{2,2} + t_{1,2}) \frac{p}{\hbar} + Q_3(\lambda, \hbar) & -\frac{p}{\hbar} + P_1(\lambda) \end{pmatrix} \\ \check{A}(\lambda, \hbar) &= \begin{pmatrix} -(t_{1,3} + t_{2,3})\lambda - \frac{H}{\hbar} + t_{2,2} & -1 \\ (t_{1,3} + t_{2,3}) \frac{p}{\hbar} + Q_2(\lambda, \hbar) & (t_{1,3} + t_{2,3})q + t_{1,2} + 2t_{2,2} - \frac{H}{\hbar} \end{pmatrix} \end{aligned}$$

where

$$\begin{aligned} Q_3(\lambda, \hbar) &= -P_{\infty,4}^{(2)} \lambda^3 - (P_{\infty,4}^{(2)} q + P_{\infty,3}^{(2)}) \lambda^2 - (P_{\infty,4}^{(2)} q^2 + P_{\infty,3}^{(2)} q + P_{\infty,2}^{(2)}) \lambda \\ &\quad + P_{\infty,4}^{(2)} q^3 + P_{\infty,3}^{(2)} q^2 + P_{\infty,2}^{(2)} q + P_{\infty,1}^{(2)} + \hbar t_{1,3} \\ Q_2(\lambda, \hbar) &= P_{\infty,4}^{(2)} \lambda^2 + 2P_{\infty,4}^{(2)} q \lambda + P_{\infty,3}^{(2)} \lambda + (3P_{\infty,4}^{(2)} q^2 + 2P_{\infty,3}^{(2)} q + P_{\infty,2}^{(2)}) \end{aligned}$$

## Open questions and outlooks

# Open questions and outlooks

- Non-perturbative quantities (wave function, Lax pairs, etc.) are **formal  $\hbar$  trans-series**  $\Rightarrow$  Can we obtain **convergent solutions**?  
Possible solution: works of Costin [9, 10, 11, 12]  $\Rightarrow$  Write down the **RHP satisfied by  $\Psi(\lambda, \hbar)$** . Make connections with (bi)orthogonal polynomials RHP in the hermitian matrix models case.
- **Remove some of the admissibility conditions**: simple ramification points, smooth ramification points.
- General connections with **isomonodromic deformations**? Require to define in general the tangent space  $\partial_{t_{i,j}}$  and “admissible” deformations of curves. Check that operators  $\mathcal{L}$  may always be written using spectral times derivatives. Prove that **time evolutions are Hamiltonian**. Issue solved for  $d = 2$  in [32, 33].
- Study the change of Torelli marking  $\Rightarrow$  Hitchin’s equations for choice of polarization in geometric quantization.
- Consider **classical spectral curves over  $\mathbb{C}^*$**  (or more complicated base curve) to study of Gromov–Witten invariants of toric Calabi–Yau three-folds by mirror symmetry.
