November, 13 2017

**I. Introduction : algebraic rewriting.**

**II. Presentation of linear  $(2, 2)$ -categories.**

**III. Quiver Hecke algebras and Poincaré-Birkhoff-Witt bases.**

# I. Introduction : algebraic rewriting.

# Algebraic rewriting

- Many algebraic properties can be formulated by equations.

**Example.**

$$\text{Associativity : } (x \cdot y) \cdot z = x \cdot (y \cdot z);$$

$$\text{Commutativity : } x \cdot y = y \cdot x;$$

$$\text{Lie algebra : } [x, x] = 0, [x, [y, z]] + [y, [z, x]] + [z, [x, y]] = 0.$$

# Algebraic rewriting

- Many algebraic properties can be formulated by equations.

**Example.**

$$\text{Associativity : } (x \cdot y) \cdot z \Rightarrow x \cdot (y \cdot z);$$

$$\text{Commutativity : } x \cdot y \Rightarrow y \cdot x;$$

$$\text{Lie algebra : } [x, x] \Rightarrow 0, [x, [y, z]] + [y, [z, x]] + [z, [x, y]] \Rightarrow 0.$$

- Algebraic rewriting** aims at orienting equations to combine abstract rewriting with the properties of the algebraic structure in which we apply rewriting.

# Algebraic rewriting

- Many algebraic properties can be formulated by equations.

## Example.

$$\text{Associativity : } (x \cdot y) \cdot z \Rightarrow x \cdot (y \cdot z) ;$$

$$\text{Commutativity : } x \cdot y \Rightarrow y \cdot x ;$$

$$\text{Lie algebra : } [x, x] \Rightarrow 0, [x, [y, z]] + [y, [z, x]] + [z, [x, y]] \Rightarrow 0.$$

- Algebraic rewriting** aims at orienting equations to combine abstract rewriting with the properties of the algebraic structure in which we apply rewriting.
  - Compute **explicit bases** of vector spaces, algebras, etc. using convergent presentations.
  - Study questions of **coherence** of algebraic structures to obtain **homotopical properties**, **Squier's theorem** etc.
  - Obtain algebraic properties : **homological properties** or **Koszulness** of an algebra.

# Algebraic rewriting

- Many algebraic properties can be formulated by equations.

## Example.

Associativity :  $(x \cdot y) \cdot z \Rightarrow x \cdot (y \cdot z)$  ;

Commutativity :  $x \cdot y = y \cdot x$  ;

Lie algebra :  $[x, x] = 0, [x, [y, z]] + [y, [z, x]] + [z, [x, y]] = 0$ .

- **Algebraic rewriting** aims at orienting equations to combine abstract rewriting with the properties of the algebraic structure in which we apply rewriting.
  - Compute **explicit bases** of vector spaces, algebras, etc. using convergent presentations.
  - Study questions of **coherence** of algebraic structures to obtain **homotopical properties**, **Squier's theorem** etc.
  - Obtain algebraic properties : **homological properties** or **Koszulness** of an algebra.
- These questions have been studied in an algebraic context for associative and commutative algebras :
  - **Gröbner bases** to compute with ideals, **Gröbner '49** and **Buchberger '65** ;
  - **Linear rewriting and Koszulness**, **Guiraud-Hoffbeck-Malbos '2017**

# Main obstructions in linear rewriting

- There are two points to be careful in a linear rewriting setting :

# Main obstructions in linear rewriting

- There are two points to be careful in a linear rewriting setting :

- How to define **rewriting steps** :

if  $u \Rightarrow v$  is a **2-cell**, then  $-u \Rightarrow -v$ , so  $v = (u + v) - u \Rightarrow u + v - v = u$ .

# Main obstructions in linear rewriting

- There are two points to be careful in a linear rewriting setting :

- How to define **rewriting steps** :

if  $u \Rightarrow v$  is a **2**-cell, then  $-u \Rightarrow -v$ , so  $v = (u + v) - u \Rightarrow u + v - v = u$ .

# Main obstructions in linear rewriting

- There are two points to be careful in a linear rewriting setting :

- How to define **rewriting steps** :

if  $u \Rightarrow v$  is a **2**-cell, then  $-u \Rightarrow -v$ , so  $v = (u + v) - u \not\Rightarrow u + v - v = u$ .

- There are **additive branchings**, and without termination the critical lemma fails.

# Main obstructions in linear rewriting

- There are two points to be careful in a linear rewriting setting :

- How to define **rewriting steps** :

if  $u \Rightarrow v$  is a **2-cell**, then  $-u \Rightarrow -v$ , so  $v = (u + v) - u \not\Rightarrow u + v - v = u$ .

- There are **additive branchings**, and without termination the critical lemma fails.

**Example.** Let  $\Delta = \langle x, y, z, t \mid xy \xrightarrow{\alpha} xz, zt \xrightarrow{\beta} zyt \rangle$ .

## II. Presentation of linear $(2, 2)$ -categories.

# Presentations of linear $(2, 2)$ -categories

- A linear  $(2, 2)$ -category  $\mathcal{C}$  is a 2-category with :
  - 0-cells  $\mathcal{C}_0$  ;
  - 1-cells  $\mathcal{C}_1$  ;
  - 2-cells  $\mathcal{C}_2$  such that for every  $p$  and  $q$  in  $\mathcal{C}_1$ , the space of 2-cells  $\mathcal{C}_2(p, q)$  between  $p$  and  $q$  is a  $\mathbb{K}$ -vector space for a field  $\mathbb{K}$  ;

# Presentations of linear $(2, 2)$ -categories

- A linear  $(2, 2)$ -category  $\mathcal{C}$  is a 2-category with :
  - 0-cells  $\mathcal{C}_0$  ;
  - 1-cells  $\mathcal{C}_1$  ;
  - 2-cells  $\mathcal{C}_2$  such that for every  $p$  and  $q$  in  $\mathcal{C}_1$ , the space of 2-cells  $\mathcal{C}_2(p, q)$  between  $p$  and  $q$  is a  $\mathbb{K}$ -vector space for a field  $\mathbb{K}$  ;
  - The map  $\star_1 : \mathcal{C}_2(p, q) \otimes \mathcal{C}_2(q, r) \rightarrow \mathcal{C}_2(p, r)$  is linear ;
  - Source and targets are compatible with the linear structure.

# Presentations of linear $(2, 2)$ -categories

- A linear  $(2, 2)$ -category  $\mathcal{C}$  is a 2-category with :
  - 0-cells  $\mathcal{C}_0$  ;
  - 1-cells  $\mathcal{C}_1$  ;
  - 2-cells  $\mathcal{C}_2$  such that for every  $p$  and  $q$  in  $\mathcal{C}_1$ , the space of 2-cells  $\mathcal{C}_2(p, q)$  between  $p$  and  $q$  is a  $\mathbb{K}$ -vector space for a field  $\mathbb{K}$  ;
  - The map  $\star_1 : \mathcal{C}_2(p, q) \otimes \mathcal{C}_2(q, r) \rightarrow \mathcal{C}_2(p, r)$  is linear ;
  - Source and targets are compatible with the linear structure.

## Objectives

- *Compute convergent presentations of these linear  $(2, 2)$ -categories.*
- *Compute normal forms using the theory of normal forms by rewriting.*

# Presentations of linear $(2, 2)$ -categories

- A linear  $(2, 2)$ -category  $\mathcal{C}$  is a 2-category with :
  - 0-cells  $\mathcal{C}_0$  ;
  - 1-cells  $\mathcal{C}_1$  ;
  - 2-cells  $\mathcal{C}_2$  such that for every  $p$  and  $q$  in  $\mathcal{C}_1$ , the space of 2-cells  $\mathcal{C}_2(p, q)$  between  $p$  and  $q$  is a  $\mathbb{K}$ -vector space for a field  $\mathbb{K}$  ;
  - The map  $\star_1 : \mathcal{C}_2(p, q) \otimes \mathcal{C}_2(q, r) \rightarrow \mathcal{C}_2(p, r)$  is linear ;
  - Source and targets are compatible with the linear structure.

## Objectives

- *Compute convergent presentations of these linear  $(2, 2)$ -categories.*
- *Compute normal forms using the theory of normal forms by rewriting.*

- There are two main difficulties :
  - The analysis of 3-dimensional critical branchings is complicated
  - One has to require termination to prove the critical pair lemma.

# Presentations of linear $(2, 2)$ -categories

- In these categories, the generating  $2$ -cells have the form of a circuit as follows :

where  $p$  and  $q$  are two  $1$ -cells of the category.

# Presentations of linear $(2, 2)$ -categories

- In these categories, the generating 2-cells have the form of a circuit as follows :

where  $p$  and  $q$  are two 1-cells of the category.

- They can be composed in two ways

Horizontally

Vertically

# Presentations of linear $(2, 2)$ -categories

- All these compositions are made modulo **the exchange law** of the **2**-category, which is diagrammatically depicted as :

that is for every **2**-cells  $\phi_1, \phi_2, \psi_1, \psi_2$  one has

$$(\psi_1 \star_0 \phi_1) \star_1 (\psi_2 \star_0 \phi_2) = (\psi_1 \star_1 \psi_2) \star_0 (\phi_1 \star_1 \phi_2)$$

# Presentations of linear $(2, 2)$ -categories

- All these compositions are made modulo **the exchange law** of the **2**-category, which is diagrammatically depicted as :

that is for every **2**-cells  $\phi_1, \phi_2, \psi_1, \psi_2$  one has

$$(\psi_1 \star_0 \phi_1) \star_1 (\psi_2 \star_0 \phi_2) = (\psi_1 \star_1 \psi_2) \star_0 (\phi_1 \star_1 \phi_2)$$

- We recall that  $\star_1 : \mathcal{C}_2(p, q) \otimes \mathcal{C}_2(q, r) \rightarrow \mathcal{C}_2(p, r)$  is linear and that all the sources and target maps are compatible with the linear structure.

# Presentations of linear $(2, 2)$ -categories

- One can also make linear combinations of these circuits with scalars in  $\mathbb{K}$ .

# Presentations of linear $(2, 2)$ -categories

- One can also make linear combinations of these circuits with scalars in  $\mathbb{K}$ . An element of the form

$$\lambda \begin{array}{|c|} \hline \dots \\ \hline \phi \\ \hline \dots \\ \hline \end{array}$$

where  $\phi$  is a **2**-cell obtained with the previous compositions of generating **2**-cells and  $\lambda \in \mathbb{K}$  is called a *monomial* in the linear  $(2, 2)$ -category.

# Presentations of linear $(\mathbf{2}, \mathbf{2})$ -categories

- One can also make linear combinations of these circuits with scalars in  $\mathbb{K}$ . An element of the form

$$\lambda \begin{array}{|c|} \hline \dots \\ \hline \phi \\ \hline \dots \\ \hline \end{array}$$

where  $\phi$  is a  $\mathbf{2}$ -cell obtained with the previous compositions of generating  $\mathbf{2}$ -cells and  $\lambda \in \mathbb{K}$  is called a *monomial* in the linear  $(\mathbf{2}, \mathbf{2})$ -category.

- Given a  $\mathbf{2}$ -cell  $\phi$ , it can be uniquely decomposed into a sum of monomials  $\phi = \sum \phi_i$ , called the *monomial decomposition* of  $\phi$ .

# Presentations of linear $(\mathbf{2}, \mathbf{2})$ -categories

- One can also make linear combinations of these circuits with scalars in  $\mathbb{K}$ . An element of the form

$$\lambda \begin{array}{|c|} \hline \dots \\ \hline \phi \\ \hline \dots \\ \hline \end{array}$$

where  $\phi$  is a  $\mathbf{2}$ -cell obtained with the previous compositions of generating  $\mathbf{2}$ -cells and  $\lambda \in \mathbb{K}$  is called a *monomial* in the linear  $(\mathbf{2}, \mathbf{2})$ -category.

- Given a  $\mathbf{2}$ -cell  $\phi$ , it can be uniquely decomposed into a sum of monomials  $\phi = \sum \phi_i$ , called the *monomial decomposition* of  $\phi$ .
- The *support* of  $\phi$  is the set of all the  $\phi_i$  in that decomposition.

# Linear $(3, 2)$ -polygraphs

- These linear  $(2, 2)$ -categories can be presented by rewriting systems called linear  $(3, 2)$ -polygraphs, Alleaume '16.

# Linear $(3, 2)$ -polygraphs

- These linear  $(2, 2)$ -categories can be presented by rewriting systems called **linear  $(3, 2)$ -polygraphs**, Alleaume '16.
- A linear  $(3, 2)$ -polygraph is a tuple  $\Sigma = \langle \Sigma_0, \Sigma_1, \Sigma_2, \Sigma_3 \rangle$  where :

# Linear $(3, 2)$ -polygraphs

- A linear  $(3, 2)$ -polygraph is a tuple  $\Sigma = \langle \Sigma_0, \Sigma_1, \Sigma_2, \Sigma_3 \rangle$  where :
  - $\langle \Sigma_0, \Sigma_1, \Sigma_2 \rangle$  is a **2-polygraph**, that is a graph  $\langle \Sigma_0, \Sigma_1 \rangle$  equipped with a cellular extension of  $\Sigma_1^*$  the free **1-category** generated by  $\Sigma_1$ , that is a set  $\Sigma_2$  and two maps  $s_1, t_1 : \Sigma_2 \rightarrow \Sigma_1^*$  such that the globular relations hold :

$$s_0 \circ s_1 = s_0 \circ t_1, t_0 \circ s_1 = t_0 \circ t_1.$$

# Linear $(3, 2)$ -polygraphs

- These linear  $(2, 2)$ -categories can be presented by rewriting systems called **linear  $(3, 2)$ -polygraphs**, Alleaume '16.
- A linear  $(3, 2)$ -polygraph is a tuple  $\Sigma = \langle \Sigma_0, \Sigma_1, \Sigma_2, \Sigma_3 \rangle$  where :
  - $\langle \Sigma_0, \Sigma_1, \Sigma_2 \rangle$  is a **2-polygraph**, that is a graph  $\langle \Sigma_0, \Sigma_1 \rangle$  equipped with a cellular extension of  $\Sigma_1^*$  the free **1-category** generated by  $\Sigma$ , that is a set  $\Sigma_2$  and two maps  $s_1, t_1 : \Sigma_2 \rightarrow \Sigma_1^*$  such that the globular relations hold :

$$s_0 \circ s_1 = s_0 \circ t_1, t_0 \circ s_1 = t_0 \circ t_1.$$

# Linear $(3, 2)$ -polygraphs

- These linear  $(2, 2)$ -categories can be presented by rewriting systems called **linear  $(3, 2)$ -polygraphs**, Alleaume '16.
- A linear  $(3, 2)$ -polygraph is a tuple  $\Sigma = \langle \Sigma_0, \Sigma_1, \Sigma_2, \Sigma_3 \rangle$  where :
  - $\langle \Sigma_0, \Sigma_1, \Sigma_2 \rangle$  is a **2-polygraph**, that is a graph  $\langle \Sigma_0, \Sigma_1 \rangle$  equipped with a cellular extension of  $\Sigma_1^*$  the free **1-category** generated by  $\Sigma_1$ , that is a set  $\Sigma_2$  and two maps  $s_1, t_1 : \Sigma_2 \rightarrow \Sigma_1^*$  such that the globular relations hold :

$$s_0 \circ s_1 = s_0 \circ t_1, t_0 \circ s_1 = t_0 \circ t_1.$$

- $\Sigma_3$  is a cellular extension of the linear  $(2, 2)$ -category  $\Sigma_2^!$  generated by  $\langle \Sigma_0, \Sigma_1, \Sigma_2 \rangle$ , that is a set equipped with two applications  $s_2, t_2 : \Sigma_3 \rightarrow \Sigma_2^!$  such that the globular relations hold :

$$s_0 \circ s_1 = s_0 \circ t_1, t_0 \circ s_1 = t_0 \circ t_1, \\ s_1 \circ s_2 = s_1 \circ t_2, t_1 \circ s_2 = t_1 \circ t_2.$$

# Linear (3, 2)-polygraphs

- These linear (2, 2)-categories can be presented by rewriting systems called linear (3, 2)-polygraphs, Alleaume '16.
- A linear (3, 2)-polygraph is a tuple  $\Sigma = \langle \Sigma_0, \Sigma_1, \Sigma_2, \Sigma_3 \rangle$  where :
  - $\langle \Sigma_0, \Sigma_1, \Sigma_2 \rangle$  is a 2-polygraph, that is a graph  $\langle \Sigma_0, \Sigma_1 \rangle$  equipped with a cellular extension of  $\Sigma_1^*$  the free 1-category generated by  $\Sigma$ , that is a set  $\Sigma_2$  and two maps  $s_1, t_1 : \Sigma_2 \rightarrow \Sigma_1^*$  such that the globular relations hold :

$$s_0 \circ s_1 = s_0 \circ t_1, t_0 \circ s_1 = t_0 \circ t_1.$$

- $\Sigma_3$  is a cellular extension of the linear (2, 2)-category  $\Sigma_2^!$  generated by  $\langle \Sigma_0, \Sigma_1, \Sigma_2 \rangle$ , that is a set equipped with two applications  $s_2, t_2 : \Sigma_3 \rightarrow \Sigma_2^!$  such that the globular relations hold :

$$s_0 \circ s_1 = s_0 \circ t_1, t_0 \circ s_1 = t_0 \circ t_1, \\ s_1 \circ s_2 = s_1 \circ t_2, t_1 \circ s_2 = t_1 \circ t_2.$$

# Linear (3, 2)-polygraphs

- **Example.** Let  $\mathcal{C}$  be the linear (2, 2)-category with one 0-cell, one 1-cell, two generating 2-cells

and two 3-cells :

$$\begin{array}{c} \bullet \\ \diagup \diagdown \\ \diagdown \diagup \\ \bullet \end{array} = \begin{array}{c} \diagup \diagdown \\ \diagdown \diagup \end{array} + \begin{array}{c} | \\ | \end{array} \quad \text{and} \quad \begin{array}{c} \bullet \\ \diagdown \diagup \\ \diagup \diagdown \\ \bullet \end{array} = \begin{array}{c} \diagdown \diagup \\ \diagup \diagdown \end{array} + \begin{array}{c} | \\ | \end{array} .$$

# Linear (3, 2)-polygraphs

- **Example.** Let  $\mathcal{C}$  be the linear (2, 2)-category with one 0-cell, one 1-cell, two generating 2-cells

and two 3-cells :

$$\begin{array}{c} \bullet \\ \diagup \diagdown \\ \diagdown \diagup \\ \bullet \end{array} = \begin{array}{c} \diagup \diagdown \\ \diagdown \diagup \\ \bullet \end{array} + \begin{array}{c} | \\ | \\ | \end{array} \quad \text{and} \quad \begin{array}{c} \bullet \\ \diagdown \diagup \\ \diagup \diagdown \\ \bullet \end{array} = \begin{array}{c} \diagdown \diagup \\ \diagup \diagdown \\ \bullet \end{array} + \begin{array}{c} | \\ | \\ | \end{array} .$$

This category can be presented by the linear (3, 2)-polygraph defined with the same 0-cell, 1-cell and 2-cells and the relations being oriented in the following way :

$$\begin{array}{c} \bullet \\ \diagup \diagdown \\ \diagdown \diagup \\ \bullet \end{array} \Rightarrow \begin{array}{c} \diagup \diagdown \\ \diagdown \diagup \\ \bullet \end{array} + \begin{array}{c} | \\ | \\ | \end{array} \quad \text{and} \quad \begin{array}{c} \bullet \\ \diagdown \diagup \\ \diagup \diagdown \\ \bullet \end{array} \Rightarrow \begin{array}{c} \diagdown \diagup \\ \diagup \diagdown \\ \bullet \end{array} + \begin{array}{c} | \\ | \\ | \end{array} .$$

# Rewriting properties of linear $(3, 2)$ -polygraphs

- A *rewriting step* of  $\Sigma$  is a **3-cell** of the form

where  $s_2(\alpha)$  and  $t_2(\alpha)$  are two parallel **2-cells** such that the monomial  $\lambda m_1 \star_1 (m_2 \star_0 s_2(\alpha) \star_0 m_3) \star_1 m_4$  does not appear in the monomial decomposition of  $u$ .

# Rewriting properties of linear $(3, 2)$ -polygraphs

- A *rewriting step* of  $\Sigma$  is a **3-cell** of the form

where  $s_2(\alpha)$  and  $t_2(\alpha)$  are two parallel **2-cells** such that the monomial  $\lambda m_1 \star_1 (m_2 \star_0 s_2(\alpha) \star_0 m_3) \star_1 m_4$  does not appear in the monomial decomposition of  $u$ .

- A *rewriting sequence* of  $\Sigma$  is a finite or infinite sequence :

$$u_0 \Longrightarrow \dots \Longrightarrow u_n \Longrightarrow \dots$$

of rewriting steps of  $\Sigma$ .

# Rewriting properties of linear $(3, 2)$ -polygraphs

- A *rewriting step* of  $\Sigma$  is a **3-cell** of the form

where  $s_2(\alpha)$  and  $t_2(\alpha)$  are two parallel **2-cells** such that the monomial  $\lambda m_1 \star_1 (m_2 \star_0 s_2(\alpha) \star_0 m_3) \star_1 m_4$  does not appear in the monomial decomposition of  $u$ .

- A *rewriting sequence* of  $\Sigma$  is a finite or infinite sequence :

$$u_0 \Longrightarrow \dots \Longrightarrow u_n \Longrightarrow \dots$$

of rewriting steps of  $\Sigma$ .

- A *normal form* is a **2-cell** that can't be reduced by any rewriting step.

# Rewriting properties of linear $(3, 2)$ -polygraphs

- A *branching* of  $\Sigma$  is a pair of  $3$ -cells with the same  $2$ -source :

  - *left monomial* if every source of a  $3$ -cell in  $\Sigma$  is a monomial.

# Rewriting results

- In this setting, we have a version of classic rewriting results such as **Noetherian's induction principle** and **Newman's lemma**.

# Rewriting results

- In this setting, we have a version of classic rewriting results such as **Noetherian's induction principle** and **Newman's lemma**.

## Proposition

A **terminating** linear **(3, 2)**-polygraph is confluent if and only if all its critical branchings are confluent.

# Rewriting results

- In this setting, we have a version of classic rewriting results such as **Noetherian's induction principle** and **Newman's lemma**.

## Proposition

A **terminating** linear  $(3, 2)$ -polygraph is confluent if and only if all its critical branchings are confluent.

## Proposition (Alleaume,'16)

Let  $\Sigma$  be a confluent and terminating left-monomial linear  $(3, 2)$ -polygraph and  $\mathcal{C}$  be the linear  $(2, 2)$ -category presented by  $\Sigma$ . Then, for any 1-cells  $u$  and  $v$  of  $\mathcal{C}$  with same 0-source and 0-target, the set of monomials of  $\Sigma$  in normal form from  $u$  to  $v$  gives a basis of  $\mathcal{C}(u, v)$ .

# Critical branchings for linear $(3, 2)$ -polygraphs

- There exists 3 kinds of non-aspherical critical branchings in that setting :

# Critical branchings for linear $(3, 2)$ -polygraphs

- There exists 3 kinds of non-aspherical critical branchings in that setting :
  - **Regular** critical branchings :

# Critical branchings for linear $(3, 2)$ -polygraphs

- **Regular** critical branchings :

- **Inclusion** critical branchings :

# Critical branchings for linear $(3, 2)$ -polygraphs

- There exists **3** kinds of non-aspherical critical branchings in that setting :

- **Regular** critical branchings :

- **Inclusion** critical branchings :

- **Left-indexed** (also **left-indexed**, **multi-indexed**) critical branchings :

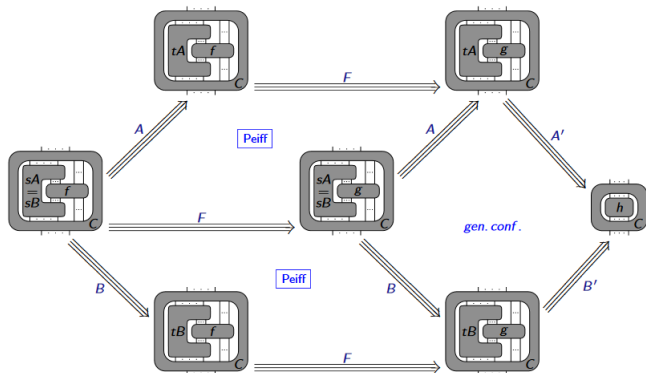

# Confluence of indexed critical branchings

- Lafont '03 and Guiraud-Malbos '09 : To prove confluence of an indexed critical branching, it suffices to prove its confluence for instances  $k$  in normal form.

# Confluence of indexed critical branchings

- Lafont '03 and Guiraud-Malbos '09 : To prove confluence of an indexed critical branching, it suffices to prove its confluence for instances  $k$  in normal form.

### III. Quiver Hecke algebras and Poincaré-Birkhoff-Witt bases

# KLR algebras for categorification of quantum groups

- In **higher dimensional representation theory**, a natural way to study an algebraic structure is to extend actions of it on categories rather than vector spaces.

# KLR algebras for categorification of quantum groups

- In **higher dimensional representation theory**, a natural way to study an algebraic structure is to extend actions of it on categories rather than vector spaces.
- One wants to build a **categorification** of it, that is an **higher dimensional category** whose Grothendieck group is isomorphic to it.

# KLR algebras for categorification of quantum groups

- In **higher dimensional representation theory**, a natural way to study an algebraic structure is to extend actions of it on categories rather than vector spaces.
- One wants to build a **categorification** of it, that is an **higher dimensional category** whose Grothendieck group is isomorphic to it.
- This work was done for a process of categorification of **quantum groups** associated with symmetrizable Kac-Moody algebras, following **Khovanov-Lauda '08** and **Rouquier '08**.

# KLR algebras for categorification of quantum groups

- In **higher dimensional representation theory**, a natural way to study an algebraic structure is to extend actions of it on categories rather than vector spaces.
- One wants to build a **categorification** of it, that is an **higher dimensional category** whose Grothendieck group is isomorphic to it.
- This work was done for a process of categorification of **quantum groups** associated with symmetrizable Kac-Moody algebras, following **Khovanov-Lauda '08** and **Rouquier '08**.
- The **KLR algebras** (or **quiver Hecke algebras**) are a family of algebras that arise naturally in this process.
  - They admit a diagrammatic presentation by generators and relations, **Khovanov-Lauda '08**
  - They can be seen as linear **(2, 2)**-categories.

# Poincaré-Birkhoff-Witt bases

- We will explicit linear  $(3, 2)$ -polygraphs that present the simply-laced KLR algebras and prove that they are **convergent**.
- We will obtain a rewriting proof of the following algebraic result obtained by Khovanov and Lauda :

## Theorem

*The simply-laced KLR algebras admit Poincaré-Birkhoff-Witt bases*

- These PBW bases have interesting algebraic and homological features.
  - They are linear bases.
  - They are build from a monomial order  $\preceq$  on a generating set of the algebra.
  - The product of two elements of the basis is greater for  $\preceq$  than every element in its monomial decomposition.

# Definition of the KLR algebras

- Let  $\Gamma$  be a graph whose set of vertices is denoted by  $I$ . We set  $\mathcal{V} = \sum_{i \in I} \nu_i \cdot i \in \mathbb{N}[I]$  an element of the free semi-group generated by  $I$ .
- Let  $\cdot$  be a bilinear form defined on  $\mathbb{Z}[I]$  with values in  $\mathbb{Z}$  such that  $i \cdot j \in \{0, -1\}$  for all  $i, j \in I$ .
- We put  $m := |\mathcal{V}| = \sum \nu_i$ .
- We consider the set  $\text{Seq}(\mathcal{V})$  which consists of all sequences of vertices of  $\Gamma$  with length  $m$  in which the vertex  $i$  appears exactly  $\nu_i$  times.
  - For instance,  $\text{Seq}(2i + j) = \{iij, iji, jii\}$ .
- For  $\mathbf{i}$  and  $\mathbf{j} \in \text{Seq}(\mathcal{V})$ , we define the set  ${}_j\mathcal{R}(\mathcal{V})_i$  as the set of "braid-like diagrams" from  $\mathbf{i}$  to  $\mathbf{j}$ , that is :
  - Each strand is labelled by a vertex of  $\Gamma$  ;
  - A strand does not intersect with itself ;
  - One has to read  $\mathbf{i}$  (resp.  $\mathbf{j}$ ) at the bottom (resp. at the top) of the diagram

# Definition of the KLR algebras

- These algebras are given by a diagrammatic presentation by generators and relations.
- For  $\mathbf{i} = i_1 \dots i_m \in \text{Seq}(\mathcal{V})$ , we represent the generators by :

- $x_{k,i} =$   for  $1 \leq k \leq m, \mathbf{i} = i_1 \dots i_m \in \text{Seq}(\mathcal{V})$

- $\tau_{k,i} =$   for  $1 \leq k \leq m - 1, \mathbf{i} = i_1 \dots i_m \in \text{Seq}(\mathcal{V})$

- These algebras can be seen as linear  $(\mathbf{2}, \mathbf{2})$ -categories with :
  - One  $\mathbf{0}$ -cell,
  - The  $\mathbf{1}$ -cells are the elements of  $\text{Seq}(\mathcal{V})$ ,
  - The  $\mathbf{2}$ -cells between two sequences  $\mathbf{i}$  and  $\mathbf{j}$  are  ${}_{\mathbf{j}}R(\mathcal{V})_{\mathbf{i}}$ .

# Definition of the KLR algebras

• The local relations are represented by :

i) For  $i \in I$ ,

$$\begin{array}{c} \diagup \diagdown \\ \diagdown \diagup \\ \diagup \diagdown \\ \diagdown \diagup \end{array} = 0$$

ii) For  $i, j \in I$  such that  $i \cdot j = 0$ ,

$$\begin{array}{c} \diagup \diagdown \\ \diagdown \diagup \\ \diagup \diagdown \\ \diagdown \diagup \end{array} = \begin{array}{c} | \\ | \end{array} \begin{array}{c} | \\ | \end{array}$$

iii) For  $i, j \in I$  such that  $i \cdot j = -1$ ,

$$\begin{array}{c} \diagup \diagdown \\ \diagdown \diagup \\ \diagup \diagdown \\ \diagdown \diagup \end{array} = \begin{array}{c} \bullet \\ | \end{array} \begin{array}{c} | \\ | \end{array} + \begin{array}{c} | \\ | \end{array} \begin{array}{c} \bullet \\ | \end{array}$$

iv) For  $i, j \in I$ ,

$$\begin{array}{c} \bullet \\ \diagup \diagdown \\ \diagdown \diagup \end{array} = \begin{array}{c} \diagup \diagdown \\ \bullet \\ \diagdown \diagup \end{array}$$

$$\begin{array}{c} \diagup \diagdown \\ \bullet \\ \diagdown \diagup \end{array} = \begin{array}{c} \diagdown \diagup \\ \bullet \\ \diagup \diagdown \end{array}$$

v) For  $i \in I$ ,

$$\begin{array}{c} \bullet \\ \diagup \diagdown \\ \diagdown \diagup \end{array} = \begin{array}{c} \diagup \diagdown \\ \bullet \\ \diagdown \diagup \end{array} + \begin{array}{c} | \\ | \end{array} \begin{array}{c} | \\ | \end{array}$$

$$\begin{array}{c} \diagup \diagdown \\ \bullet \\ \diagdown \diagup \end{array} = \begin{array}{c} \diagdown \diagup \\ \bullet \\ \diagup \diagdown \end{array} - \begin{array}{c} | \\ | \end{array} \begin{array}{c} | \\ | \end{array}$$

vi) For  $i, j, k \in I$ , and unless  $i = k$  and  $i \cdot j = -1$ ,

$$\begin{array}{c} \diagup \diagdown \\ \diagdown \diagup \\ \diagup \diagdown \\ \diagdown \diagup \end{array} = \begin{array}{c} \diagdown \diagup \\ \diagup \diagdown \\ \diagdown \diagup \\ \diagup \diagdown \end{array}$$

vii) For  $i, j \in I$  such that  $i \cdot j = -1$ ,

# The linear $(3, 2)$ -polygraphs KLR

- The **3**-cells of the linear  $(3, 2)$ -polygraph **KLR** are given by :

i) For  $i \in I$ ,

$$\begin{array}{c} \diagup \quad \diagdown \\ \diagdown \quad \diagup \\ \diagup \quad \diagdown \\ \diagdown \quad \diagup \end{array} \Rightarrow 0$$

ii) For  $i, j \in I$  such that  $i \cdot j = 0$ ,

$$\begin{array}{c} \diagup \quad \diagdown \\ \diagdown \quad \diagup \\ \diagup \quad \diagdown \\ \diagdown \quad \diagup \end{array} \Rightarrow \begin{array}{c} | \\ | \end{array} \quad \begin{array}{c} | \\ | \end{array}$$

iii) For  $i, j \in I$  such that  $i \cdot j = -1$ ,

$$\begin{array}{c} \diagup \quad \diagdown \\ \diagdown \quad \diagup \\ \diagup \quad \diagdown \\ \diagdown \quad \diagup \end{array} \Rightarrow \begin{array}{c} \bullet \\ | \end{array} \quad \begin{array}{c} | \\ | \end{array} + \begin{array}{c} | \\ | \end{array} \quad \begin{array}{c} | \\ | \end{array} \quad \begin{array}{c} \bullet \\ | \end{array}$$

iv) For  $i, j \in I$ ,

$$\begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \diagdown \quad \diagup \\ \bullet \end{array} \Rightarrow \begin{array}{c} \diagup \quad \diagdown \\ \diagdown \quad \diagup \\ \bullet \end{array}$$

$$\begin{array}{c} \diagup \quad \diagdown \\ \bullet \\ \diagdown \quad \diagup \\ \bullet \end{array} \Rightarrow \begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \diagdown \quad \diagup \\ \bullet \end{array}$$

v) For  $i \in I$ ,

$$\begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \end{array} \Rightarrow \begin{array}{c} \diagup \quad \diagdown \\ \bullet \\ \diagdown \quad \diagup \end{array} + \begin{array}{c} | \\ | \end{array} \quad \begin{array}{c} | \\ | \end{array}$$

$$\begin{array}{c} \diagup \quad \diagdown \\ \bullet \\ \bullet \end{array} \Rightarrow \begin{array}{c} \diagup \quad \diagdown \\ \bullet \\ \bullet \end{array} - \begin{array}{c} | \\ | \end{array} \quad \begin{array}{c} | \\ | \end{array}$$

vi) For  $i, j, k \in I$ , and unless  $i = k$  and  $i \cdot j = -1$ ,

$$\begin{array}{c} \diagup \quad \diagdown \\ \diagdown \quad \diagup \\ \diagup \quad \diagdown \\ \diagdown \quad \diagup \end{array} \Rightarrow \begin{array}{c} \diagup \quad \diagdown \\ \diagdown \quad \diagup \\ \diagup \quad \diagdown \\ \diagdown \quad \diagup \end{array}$$

vii) For  $i, j \in I$  such that  $i \cdot j = -1$ ,

$$\begin{array}{c} \diagup \quad \diagdown \\ \diagdown \quad \diagup \\ \diagup \quad \diagdown \\ \diagdown \quad \diagup \end{array} \Rightarrow \begin{array}{c} \diagup \quad \diagdown \\ \diagdown \quad \diagup \\ \diagup \quad \diagdown \\ \diagdown \quad \diagup \end{array} + \begin{array}{c} | \\ | \end{array} \quad \begin{array}{c} | \\ | \end{array} \quad \begin{array}{c} | \\ | \end{array}$$

# The linear $(3, 2)$ -polygraphs KLR

- We prove the following result :

## Theorem

*The linear  $(3, 2)$ -polygraphs  $KLR$  are convergent.*

# The linear $(3, 2)$ -polygraphs KLR

- We prove the following result :

## Theorem

*The linear  $(3, 2)$ -polygraphs  $KLR$  are convergent.*

- The proof is split into two parts :
  - We prove that  $KLR$  is terminating.

# The linear $(3, 2)$ -polygraphs KLR

- We prove the following result :

## Theorem

*The linear  $(3, 2)$ -polygraphs  $KLR$  are convergent.*

- The proof is split into two parts :
  - We prove that  $KLR$  is terminating.
  - Then, we show that it is confluent by examining all the critical branchings.

# The linear $(3, 2)$ -polygraphs KLR

- We prove the following result :

## Theorem

*The linear  $(3, 2)$ -polygraphs  $KLR$  are convergent.*

- The proof is split into two parts :
  - We prove that  $KLR$  is terminating.
  - Then, we show that it is confluent by examining all the critical branchings.
- The monomials in normal form give a basis for each space of  $2$ -cells, which provide a basis of the algebra. It turns out to be a Poincaré-Birkhoff-Witt basis.

# The linear $(3, 2)$ -polygraphs KLR

# Study of the critical branchings

- There is right indexed branchings with the form :

where  $k$  is a diagram that can be plugged in the Yang-Baxter-equation.

# Study of the critical branchings

- There is right indexed branchings with the form :

where  $k$  is a diagram that can be plugged in the Yang-Baxter-equation.

- There are two families of normal forms that can be plugged :

-   $n$  for all  $n \in \mathbb{N}$  ( just the identity if  $n = 0$  )

-  for all  $n \in \mathbb{N}$

# Study of the critical branchings

- There is right indexed branchings with the form :

where  $k$  is a diagram that can be plugged in the Yang-Baxter-equation.

- There are two families of normal forms that can be plugged :

-   $n$  for all  $n \in \mathbf{N}$  ( just the identity if  $n = 0$  )

-  for all  $n \in \mathbf{N}$

- The two families of indexed critical branchings are confluent, so is the linear  $(3, 2)$ -polygraph [KLR](#).

# Study of the normal forms : crossings

# Study of the normal forms : crossings

- Lafont '03 and Guiraud-Malbos '09 made a full study of the normal forms of the 3-polygraph of permutations  $\Delta$  which has
  - One 0-cell ;
  - One 1-cell ;
  - One 2-cell  ;
  - The following two 3-cells :  and .

# Study of the normal forms : crossings

- Lafont '03 and Guiraud-Malbos '09 made a full study of the normal forms of the 3-polygraph of permutations  $\Delta$  which has
  - One 0-cell ;
  - One 1-cell ;
  - One 2-cell  ;
  - The following two 3-cells :  and .
- The set of normal forms of this polygraph correspond to braid diagrams with a minimal number of crossings, that is they are given by permutations whose length is minimal for the Coxeter presentation of  $S_m$ .

# Study of the normal forms : dots

- Starting from a diagram

here the  $D_i^{\text{low}}$  are diagrams with less crossings.

# Study of the normal forms : dots

- Starting from a diagram

where the  $D_i^{\text{low}}$  are diagrams with less crossings.

# Study of the normal forms : dots

- Starting from a diagram

where the  $D_i^{\text{low}}$  are diagrams with less crossings.

# Study of the normal forms : dots

- Starting from a diagram

where the  $D_i^{\text{low}}$  are diagrams with less crossings.

- The monomial in normal forms are exactly the diagrams which have a minimal number of crossings and all dots placed at the bottom of the strands.

# Conclusion

- Rouquier '08 defined an algebraic Poincaré -Birkhoff-Witt property ;
- It is equivalent to the fact that these diagrams with dots at the bottom and a minimal number of crossings form a basis of the algebra.

# Conclusion

- Rouquier '08 defined an algebraic Poincaré -Birkhoff-Witt property ;
- It is equivalent to the fact that these diagrams with dots at the bottom and a minimal number of crossings form a basis of the algebra.
- Khovanov and Lauda '08 looked at a basis for  ${}_{j}R(\mathcal{V})_i$ .
  - It contains the diagrams of the required form.
  - The proof of the generating part used the idea of reducing the number of crossings and making the dots go down.
  - The proof of the freeness was done by defining an action of the family on a polynomial ring.

# Conclusion

- Rouquier '08 defined an algebraic Poincaré -Birkhoff-Witt property ;
- It is equivalent to the fact that these diagrams with dots at the bottom and a minimal number of crossings form a basis of the algebra.
- Khovanov and Lauda '08 looked at a basis for  ${}_{j}R(\mathcal{V})_i$ .
  - It contains the diagrams of the required form.
  - The proof of the generating part used the idea of reducing the number of crossings and making the dots go down.
  - The proof of the freeness was done by defining an action of the family on a polynomial ring.
- Using linear rewriting techniques, we proved that the simply-laced KLR algebra admits bases of type Poincaré Birkhoff-Witt.

- The theorem of categorification lays on the fact that one can find explicit bases for each space of **2**-cells in the "candidate" **2**-category.

# Work in progress :

- The theorem of categorification lays on the fact that one can find explicit bases for each space of **2**-cells in the "candidate" **2**-category.
- There is an action of the KLR algebras on some of these spaces of **2**-cells ; and we can find bases for them using our PBW bases.

# Work in progress :

- The theorem of categorification lays on the fact that one can find explicit bases for each space of **2**-cells in the "candidate" **2**-category.
- There is an action of the KLR algebras on some of these spaces of **2**-cells ; and we can find bases for them using our PBW bases.
- To recover all the bases for general spaces of **2**-cells, there are adjunction morphisms (cup and cap) that appear and the rewriting techniques become more complicated.

THANKS FOR YOUR  
ATTENTION.
